In the earlier part of his talk Lord Moran attempted to define courage. Half a dozen answers, he said, might be given to the question "What is courage?"—that it was will power, lack of imagination, just phlegm, the result of discipline, the infection of example, the result of any idea which for the moment, possessing one, swept away fear. But three parts of courage was in control. A man had in his bank, said Lord Moran, a certain amount of courage, and when he became overdrawn he was finished as a soldier. It was not a fixed amount, for there was paying in as well as drawing out, but in the long run the soldier found that time was against him. People wore out in war just like clothes. Fatigue affected the soldier exposed to peril and hardship in exactly the same way as it affected the civilian who worked too hard over too long a stretch. One of the factors that lowered the morale of a soldier was his own thoughts—thoughts which went on festering in the mind.

In conclusion Lord Moran asked—and answered—three questions. Could war make any man a coward in time? He gave the verdict—without any time for the supporting proof—that modern war signally failed to make cowards out of good stock. When modern war had done its worst, if a man behaved badly and was unable to control his instincts, there was something wrong with the stock from which he came. Was imagination a help or a handicap in war? If imagination was controlled by character it meant the blossoming of the finest people of our land. And, finally, was courage common? If by courage was meant the capacity to act under orders it was common enough, but if by courage was meant the quality which gave a man some measure of leadership, then all the finest things in war as in peace were the possession of a few—a fraction of the people—in whose keeping was the honour of the race.

GYNAECOLOGY AND OBSTETRICS

At the April meeting of the North of England Obstetrical and Gynaecological Society Prof. D. **Dougal** demonstrated a specimen of granulosa-cell tumour of tubal type.

The patient, aged 22, had been married 2 years, and had a history of a three-months miscarriage soon after marriage. She complained of 17 months' continuous uterine haemorrhage, with backache as the only other symptom. The menarche had occurred at 11 years and her menstrual habit was 7/42 until the onset of the present complaint. Previous medical and surgical history was uneventful. Examination showed a well-developed young woman with normal secondary sex characteristics. Anaemia was present as a result of the bleeding. The right ovary appeared to be replaced by a readily palpable solid tumour about the size of a tennis ball. Granulosa-cell tumour was diagnosed, and on laparotomy this was confirmed, and in addition there was evidence of an antecedent pelvic infection leaving light film-like adhesions. Right salpingo-oophorectomy was performed. For three years she had now been perfectly well and had menstruated regularly, but she had not as yet become pregnant.

The specimen was a solid ovarian tumour, almost spherical, diameter 3 in. The tumour was encapsuled, lobulated, and of a bright yellow colour. Its consistence was firm and elastic. The histological picture showed well-developed tubules more or less divided into lobules by incomplete septa well supplied with blood vessels. The remainder of the ovary, containing Graafian follicles, etc., was seen stretched over the tumour outside the capsule. No recent corpora lutea were present. The general arrangement of the tumour suggested that it had originated in the medulla or hilum. The tumour was an encapsuled, luteinized, and hormonally active adenoma of the ovary. The hormonal activity seemed to be oestrogenic. It was a highly differentiated tumour, but along unusual lines, the tubular arrangement being not unlike that of Pick's testicular adenoma of the ovary, which, however, was a virilizing tumour. Traut and Butterworth (1937) described and illustrated a tubular type of granulosa-cell tumour. Similar types have been described by Varangot (1938) and D. N. Henderson (1942). In Henderson's case there was vaginal bleeding with precocious development of sex characters in a girl aged 7 years. This type of granulosa-cell tumour must be extremely rare.

Primary Carcinoma of Fallopian Tube

Dr. W. R. ADDIS read a note on three cases of primary carcinoma of the Fallopian tube. He pointed out that the first primary carcinoma of the Fallopian tube ever recorded was by Renaud of Manchester in 1847. In the next 96 years 227 cases were traced in the literature. They occurred in gynaecological cases roughly 1 in 6,000. This formed 0.5% of genital cancers in women. There was a survival rate of about 6%. Three cases had been recorded previously in the North of England Society.

The first was that of a woman of 39 who had had a child 17 years before. She had bearing-down pain with occasional gushes of clear fluid per vaginam, and this seemed to relieve the pain. The uterus was definitely enlarged and a fullness could be felt in both fornices. Supravaginal hysterectomy with the removal of both appendages was performed. The uterus contained a small fibroid. Both tubes were closed and dilated, and contained clear fluid. Projecting into the cavity of the left tube was a mass about the size of a thumbnail which proved to be a papillary adenocarcinoma. Soon after returning home she developed ascites and swelling of both legs and died within a year.

The second case was that of a married woman aged 55, a virgo intacta. There had been a slight post-menopausal haemorrhage for two months. Gushes of clear fluid occurred, noticed while playing golf. Diagnostic curettage revealed nothing abnormal. Six months later when she was seen again a large pelvic mass could be felt to the right of the uterus, having a fungating projection into the vagina. She died within a year of first being seen. In spite of the absence of pathological evidence, the history of intermittent gushes, etc., pointed to a primary carcinoma of the Fallopian tube.

The third case was that of a woman aged 60. She had two children. For five weeks she had had a blood-stained discharge; and she thought that she was having sudden losses of urine accompanied by lower abdominal pain on the left side. On dilatation of the cervix several ounces of fluid escaped, and this was collected. Bimanual examination showed a soft mass in the left lateral fornix. The fluid was reported by the laboratory as not being urine. Panhysterectomy was performed. The specimen showed a solid tumour about 1¼ in. by 1¼ in. just proximal to the fimbriated end of the left tube. The uterus contained a small endometrial polypus. Doran had described a watery discharge in 47% of cases, and it seemed to be the most typical symptom. Pain sometimes (but not always) accompanied this phenomenon. The expectation of life was apparently short. Dr. Tod of the Radium Institute pointed out that these cases were difficult for deep *x*-ray or radium therapy because of the mobility of parts and the fact that this type of cancer was resistant to radiation.

Peroneal Palsy after Parturition

Miss ELEANOR M. MILLS read a short paper on peroneal palsy following parturition. This was described by von Basedow in 1838, after which the majority of contributions had come from French obstetricians. In 1939 only 107 cases had been reported in the literature, though the condition was fairly common. The seven cases described by Miss Mills had been collected from the local records of hospitals over a period of three years.

The first case was a second para aged 37. Two years before, she had been delivered of a 9½-lb. baby with difficulty and forceps. Soon after delivery paresis of the dorsiflexors of the left ankle had appeared, and it was six months before she was able to get about. She had a contracted true conjugate, and a narrow subpubic angle and outlet. She still dragged her left foot slightly, tended to walk on the ball of the foot, and there was some definite wasting of the anterior tibial group of muscles on the left side. She was induced about three weeks before term, and labour progressed satisfactorily except for low forceps. A live 8½-lb. child was delivered. There were no signs of peripheral nerve damage after this delivery.

The second case showed some general contraction of the pelvis. The head was occipito-posterior, and manual rotation and forceps were required. Considerable force was necessary for extraction. The child was delivered strictly in the antero-posterior position. A stillborn 9-lb. baby was produced. On the next day the mother had pain, numbness, and tingling over the outer aspect of the left thigh and the whole of the leg and foot. Full dorsiflexion could not be obtained, and over the dorsum of the foot there was diminution of the epicritic sensation. By the sixth day she had regained full dorsiflexion and all disturbances of sensation had disappeared.

The third case was a primigravida. She had a long labour; the position of the child was occipito-posterior. Manual rotation and forceps extraction were performed with difficulty. A stillborn baby was delivered. Ten weeks after delivery, when seen by Miss Mills, she was noticed to have a generally contracted pelvis. She limped badly. Complete loss of eversion and extension of the ankle-joint were present, all sensory symptoms having by this time disappeared.

The fourth case, aged 34, was a primipara with ample measurements. The position was left occipito-anterior. She had a long first stage (77 hours) followed by a mid-forceps extraction. Delivery was exceedingly difficult. The child, 8 lb., was extracted. Pain in the right leg was complained of, and paresis of the anterior tibial and peroneal muscles of the right leg was found. Foot-drop was still present when she was transferred to the orthopaedic surgeon on leaving hospital.

The fifth case was a sixth para who was in labour 44 hours. The presentation was a brow lying in the right oblique diameter with face to the front. A craniotomy was necessary. Two days later pain appeared in the right leg and then paresis followed. She was treated by passive movements, and by the time of discharge the condition had cleared up.

In the sixth case manual rotation was necessary after a fairly normal labour and an 8¼-lb. baby was extracted with some difficulty. The next day cramp-like pain was felt in the left leg, and shortly afterwards paralysis followed. No sensory loss was detected. On discharge three weeks later the paralysis of the dorsiflexors of the left foot was still nearly complete. She was referred to an orthopaedic clinic.

The seventh case was one of albuminuria of pregnancy; but, as the albumin persisted, she was induced by rupturing the membranes at 38 weeks. The position was L.O.P. A deep transverse arrest of the head occurred; and manual rotation and forceps extraction were necessary, and were performed apparently without much difficulty. Next day tingling was felt in the right lower limb and dorsiflexion was impossible. There was no sensory loss. One month later there was still some slight degree of paralysis.

In the commentary Miss Mills pointed out that one or more of three essential factors were always present: disproportion, prolonged or difficult labour, or instrumentation. It appeared that the upper roots of the sacral plexus lay against bony walls of the pelvis and were thus exposed to pressure during certain difficult labours. Dorsal offshoots of these nerves received the chief injury. The external popliteal nerve was made up of these fibres, and therefore paralysis was chiefly located in the distribution of this nerve. The main mass of the sacral plexus was to some extent cushioned by the pyriformis muscle. It would seem that it was in the generally contracted pelvis rather than the rachitic pelvis that the plexus was in a more vulnerable position, because of the deep niches on either side of the projecting vertebral promontory in the rachitic pelvis. It would be noted that in two cases only did the paralysis occur on the side on which one would expect the pressure from the foetal head to occur. One must presume that the peroneal nerve had been damaged by instrumentation in four of the cases.

Lower-segment Caesarean Section

Dr. K. V. BAILEY read a paper on this subject. Since a previous paper which he gave to the Society in 1934 his series had increased by 285 cases, of which 75 had been elective. The operation had been carried out twice in 45 cases, three times in 4 cases, and four times in 1 case. There were 2 maternal deaths, and 3 children failed to survive. He had never been in two minds concerning the superiority of this operation over the ordinary classical one. In his series there were 22 cases in which the indication was placenta praevia. Particularly with local analgesia, bleeding was not excessive, and there had been no cases of sepsis or embolus. In the cases in which a lower-segment operation had been carried out more than once in the same patient he had always been gratified to find the perfect healing which the lower segment had undergone and the almost universal lack of adhesions to the scar. Five patients delivered themselves through the pelvis following lower-segment Caesarean section. He regretted that the majority of the cases—all but 31—had been under general anaesthesia. He now favoured local analgesia; if he had any criticism it would be (1) that the perfect premedication for all types was difficult to find; (2) that the well-trained nursing staff essential to deal with the mental and physical preparation of the patient and the theatre staff to assist at operation were not always available in outlying hospitals and nursing homes; and (3) that there might be some effects of premedication upon the child, for there was no doubt that the respiratory centre in some infants was highly susceptible to the influence of narcotic drugs.

He reiterated his view that lower-segment Caesarean section was the operation of choice in all cases, while admitting that the risk increased rapidly in non-elective cases, and particularly when potential or actual sepsis was present. But he believed the operation to be safest for mother and foetus. It could be used in clear, suspected, or infected cases without jeopardizing the general condition of the patient or exposing her to peritonitis. It allowed the use of trial labour, avoided embryotomy of the living foetus, and permitted the development of subsequent pregnancies without fear of uterine rupture. The operation should be carried out as often as possible before the commencement of labour or early in labour. The question of clinical skill in the assessment of indications and contraindications would, of course, always remain.

In the course of his paper Dr. Bailey gave some account of opinion in the United States, where the classical operation was still in vogue, notwithstanding the exclamation of one prominent American obstetrician, "How long will it be before the classical Caesarean section is outlawed?"

EXOPHTHALMOS AND ENDOCRINE DISTURBANCES

A discussion on this subject took place at a meeting of the Section of Ophthalmology of the Royal Society of Medicine on June 8, Mr. P. E. H. ADAMS presiding.

Dr. W. RUSSELL BRAIN said that this was a complex problem for which no current hypothesis was adequate. The syndrome called exophthalmic ophthalmoplegia was characterized by exophthalmos, chemosis, external ophthalmoplegia, swelling of lids, and, in severe cases, papilloedema. The puzzling feature in its aetiology was that such a clinical picture might be associated with (1) thyrotoxicosis, (2) myxoedema, or (3) a normal state of thyroid function. Two conflicting solutions had been proposed by British workers. Mulvany[1] believed that there were two forms of exophthalmos—thyrotoxic and thyrotrophic. Rundle and Pochin[2] maintained that exophthalmos in Graves's disease was due to an increase in bulk of retro-ocular tissues, the increase being due to fat and being greatest in the eye muscles. Rundle and Wilson[3] proposed to distinguish two forms of Graves's disease—an ophthalmic form without thyrotoxicosis, and a thyrotoxic form. Clearly this view was unsatisfactory, for if the ophthalmoplegia was due to increased fat caused by thyrotoxicosis what could be the cause of it in non-thyrotoxic cases?

There was now considerable evidence in favour of thyrotoxic exophthalmos and ophthalmoplegia, however thyrotoxicosis might operate. Some evidence had been forthcoming that exophthalmos might be produced by administration of thyroid extract and disappear on its withdrawal. There was also to be remembered the improvement in both exophthalmos and ophthalmoplegia which sometimes followed thyroidectomy, but neither exophthalmos nor ophthalmoplegia was usually severe in thyrotoxicosis, except perhaps in older patients. It must not be too readily assumed that exophthalmos which was not thyrotoxic was thyrotrophic, and vice versa. Might there not be a further factor? After thyroidectomy there was commonly a rapid gain in weight, and already, owing to the thyrotoxicosis, there was increased fat in the orbits. What was the effect of the rapid deposition of more fat? Were the progressive exophthalmos and ophthalmoplegia in such cases to some extent mechanically induced? If so, three causes of exophthalmic ophthalmoplegia would have to be recognized—namely, thyrotoxicosis, thyrotrophicosis, and the rapid change from thyrotoxicosis to hypothyroidism or even to normal.

Dr. Brain reviewed 61 cases he had seen, in 11 of which the condition had followed thyroidectomy and in 1 had followed thiouracil. In the post-thyroidectomy group males were affected at least four times as often as females, and as females got hyperthyroidism nine times as often as males, males were 36 times more likely than females to get exophthalmic ophthalmoplegia after thyroidectomy for thyrotoxicosis. This striking sex difference seemed to favour an endocrine factor in aetiology rather than mere increase in weight or myxoedema. For treatment he had chiefly used oestrogen for both sexes. The results were mostly disappointing, occasionally good. Most patients improved up to a point. He had increased the dose up to 20 mg. of stilboestrol in some cases.

An Attempt at Grouping

Prof. IDA MANN said that part of the difficulty of diagnosis might arise from failure to recognize that two entirely different conditions were concerned. It was possible to distinguish clinically between the condition in which there was a large amount of exophthalmos with a great deal of lid retraction, but no true oedema of the lids themselves, and the condition in which there was true oedema of the lids with proptosis. She divided her series of cases into three groups in the attempt to find out whether it was possible to distinguish from a clinical and treatment point of view these two main types—namely, one due to excess thyroxine, and the other to the action of the anterior lobe of the pituitary. The pituitary undoubtedly had a regulating mechanism, and under conditions of stress it might secrete more thyrotrophic hormone because there was need for more thyroxine to meet the emergency. Her three groups were as follows:

1. Cases in which there had been a primary deficiency of thyroxine with a compensatory excess of thyrotrophic hormone, which was thus present without thyroxine to utilize it. These were people in whom a gain in weight was first noted, coinciding with exophthalmic ophthalmoplegia and oedema of the lids.
2. Cases in which there was a history suggesting thyrotoxicosis, the initial symptoms being loss of weight, tachycardia, tremor, followed by ophthalmoplegia and exophthalmos. These were people in whom there had been an excess of thyroxine, and the thyroid had then atrophied or had been removed, and the symptoms had arisen sometimes following mental shock or anxiety.
3. Cases in which both conditions appeared to have started simultaneously—loss of weight, tachycardia, tremor, exophthalmos, and ophthalmoplegia all coming on after sudden shock.

Her first group consisted of three men and one woman, all between 50 and 60. Two conditions could be distinguished clinically in these people: oedema of subcutaneous tissue and protrusion of orbital fat. These two conditions looked quite different and felt different on palpation. In this group the basal metabolic rate was consistently low.

In the second group there were 10 cases—8 men and 2 women, their ages ranging from 44 to 76. In 7 of the cases there was a definite history of shock or mental strain, often associated with air raids. The basal metabolic rate was low among those who had had thyroidectomy, high among those who had not. The main line of treatment was thyroid extract for those who had had thyroidectomy, also tarsorrhaphy and plastic operations where necessary.

In the third group there were 4 cases—3 males and 1 female. All had a raised metabolic rate. In two cases there was much improvement after thyroidectomy or deep *x*-ray therapy, and others benefited from rest and operation on the eyelids.

End-results of a Syndrome

Dr. S. L. SIMPSON said that much might be done by a psychiatric approach to the problem in view of the large part which anxiety or shock played in thyrotoxicosis and in exophthalmic ophthalmoplegia. Much had been learned in recent years about duodenal ulcers, extrasystoles, disordered action of the heart, and effort syndrome, and it all seemed to depend upon which part of the tissues of an individual was susceptible to impulses from the hypothalamus and perhaps from the pituitary. He could not help thinking that they were looking at the end-results of a syndrome which could produce such widespread effects. Once aware of the mechanism, they could spend more time on the psychiatric approach.

He put forward a theory which he hoped to have the opportunity of testing in selected cases—namely, that in all these cases there was activity of the thyrotrophic hormone, and in some of them plus thyroxine. He had seen many hundreds of cases of people who had had very large doses of thyroxine, producing sweating and so forth, and he had never seen—though he knew it was reported here and there—exophthalmos of any severity caused by thyroxine alone. He thought that thyroxine must be ruled out as an uncomplicated cause of exophthalmos. If it was accepted that the pituitary thyrotrophic hormone operated both in Graves's disease and in the exophthalmic ophthalmoplegic group, in those cases which presented a different clinical picture the thyroid was incapable of responding to the thyrotrophic hormone. This was not improbable on clinical grounds, considering that the age of the patients concerned was about 50, and that they were predominantly in males, the thyroid being much less labile in men than in women. The theory could be put to the test by injecting these people with thyrotrophic hormone and watching for a rise in the basal metabolic rate.

Simple and Malignant Exophthalmos

Mr. E. E. Pochin said that Rundle and he had collected a series of 17 cases of thyrotoxicosis coming to necropsy and had made a full removal of the orbital contents. Among other findings they established that the position of the eye was correlated with the degree to which the orbit was filled post mortem, and that that tissue was increased in the exophthalmic subject. Their diagnosis was that 6 of the 17 thyrotoxic cases had exophthalmos; in all these cases it was a simple exophthalmos, not the so-called malignant type, with oedema of the conjunctiva and chemosis. The position of the eye was correlated with a corresponding increase in the bulk of the retrobulbar tissues, and such increase was due to an increase of fat in the orbital tissues. This change occurred not only in exophthalmos subjects but generally in the whole group.

What was the relation between simple exophthalmos and malignant exophthalmos, in which there were florid and marked changes? Here he thought they should suspend judgment, not coming down at present too heavily on one side or the other. He did not think it could be established that the two were the same condition or different stages of the same condition, but equally it could not be established that the one was essentially different from the other. The distinction between simple and malignant exophthalmos was made at a stage when it was thought that simple exophthalmos was not associated with increase of bulk or with ophthalmoplegia, whereas malignant exophthalmos was so associated. But it had now been shown that there was an increase of bulk in such cases, though it was small, corresponding to the smaller degree of exophthalmos. On the other hand, it was quite clear that there were differences histologically between the simple and the malignant type. In the latter a gross oedema was present which was not found in the former. It was possible that the two were just the mild and the severe stages of a common process associated with increasing bulk of the retrobulbar tissues, and that when that bulk reached a certain stage secondary complications, possibly interference with vascular drainage of the eye, were encountered.

Nova et Vetera

THE FOLK-LORE OF TOOTHACHE

The quinquennial Wallis lecture on the history of dentistry[1] held before a joint meeting of the Sections of Odontology and the History of Medicine of the Royal Society of Medicine was delivered by Dr. J. D. Rolleston on Dec. 30, 1944.

After a short account of the popular aetiology of toothache, in which the worm played a prominent part, the lecturer dealt with the various forms of folk-lore treatment, which he classified as follows: human, animal, plant, and mineral remedies; transfer, hydrotherapy, charms, patron saints, especially St. Apollonia; filling, extraction, and miscellaneous cures. Owing to the wealth of material, as was shown by the extensive bibliography, no reference was made to superstitions connected with discoloration and mutilation of the teeth in savage races, the legend of the Golden Tooth, the tooth-brush and toothpick, and the various aspects of dental surgery apart from a brief allusion to filling and extraction. The lecture was illustrated by portraits of Pierre Fauchard, "the father of dentistry"; Peter Lowe, the founder of the Faculty of Physicians and Surgeons of Glasgow; Karl Sudhoff, the historian and author of a history of dentistry; Sir Armand Ruffer, the palaeo-pathologist; and Mr. C. E. Wallis.

H. Ingraham and A. Hesse (*Amer. J. Syph. Gon. ven. Dis.*, 1944, **28**, 733) report a case of transmission of syphilis from a mother to her child *in utero* and from the child after birth to the father by contamination of his conjunctiva.

Correspondence

Bridging the Gap

Sir,—Dr. Ff. Roberts (June 16, p. 848), in common with the late Sir Thomas Lewis and the Goodenough Committee, stresses the importance of the transition from the pre-clinical to the clinical part of the medical course. He places much responsibility on the pre-clinical teacher, but while many of his assertions are individually salutary, there is another way of looking at the question. When the student starts pre-clinical work his mind, so far as the physical constitution of man is concerned, is a blank. In 18 months he must learn the language in terms of which he will think for the rest of his life. It includes not only the names, relations, and derivations of the parts of the body, but a visual or other mental image of the living systems and their interrelations. He is finally supposed to be able to regard a man as a whole, and in contemplating any part of him to see it in relation to its surroundings, and from it to be able to pursue any one of half a dozen physiological lines of thought which must not be confined within the barriers of the "systems" of formal teaching.

To raise the student by any method of teaching from zero to this point in the available time is impossible. He must raise himself, and he must use books, remembering that there is no perfect textbook and there never will be. Whatever the source of his knowledge, whether experiment or the spoken or written word, it is of little value unless he is building it into his own purely personal understanding of the body. The function of the teacher is to give instruction, guidance, and inspiration, always with the aim of fostering this self-reliant approach to facts which students often refer to as a desire to "get to the bottom of the matter"—in other words, to satisfy their own personal criteria of understanding. The aim is qualified by the practical necessity that whatever interest is aroused by a part, the final result must be an understanding of the whole, and the time is limited.

It is pardonable, and even desirable, in pre-clinical teachers that they should employ some diversity of method in achieving this end. I know of none who underrates the importance of bringing the student into the closest contact by way of his senses with the facts he must use as raw material. But many physiological and anatomical facts must be accepted at second hand, and the synthesis of all he knows, including the explanatory application of his previous knowledge of the physical sciences, must be a mental process and personal to the student. The teacher can help him greatly, but he cannot do his thinking and visualizing for him. Much of the raw material which is used in reaching the limited objective of understanding how the body is made and works has no other purpose, though it may serve to inculcate careful habits of observation and reasoning.

I conceive that the Goodenough Committee's emphasis on principles rather than facts, whatever they may mean by the actual words, is an expression of the belief that an understanding of the body as a whole—or perhaps one should say a working knowledge—can be achieved by the use of fewer facts than are now presented. Many clinical teachers believe that the selected facts should be "useful" to the student in his clinical years. There is sufficient truth in these ideas to make them deceptive if seen out of perspective. An attempt to apply them at present may be expedient, but should not be made blindly, or with our vision clouded by lip-service to a thorough scientific training. Medical scientific knowledge will continue to grow and cannot even now be encompassed by the medical student. The real question is whether he should base his understanding of the body on as few or as many facts as possible.

The foregoing remarks bear directly on the transition to clinical work. A man going to live in a foreign country may be equipped with a thorough grounding in the language, or with a phrase book, or with a compound of the two. Only experience can show the influence of previous training on his ability to become a useful citizen. In any event, the mitigation of his difficulties in the first few weeks will depend chiefly on those who receive him, and particularly on their sympathetic realization that by their standards he is woefully ignorant whatever the system on which he has been taught. Otherwise, the transition is a stimulating experience and not to be feared.

In pointing out the responsibility of the clinical teacher I again emphasize the magnitude of the *main* task of pre-clinical teachers in relation to the time at their disposal. The majority of them carry it out thoughtfully and to the best of their ability and with the knowledge that it is contributory. Some of their machinery, taken out of its framework, is susceptible to ridicule. Many desirable methods involving the use by students of anaesthetized mammals are excluded by law. Good and bad teachers and good and bad research workers are diffused throughout the course, and the sum of their influence defies easy generalization. A realistic approach to the problem of how to educate a doctor should not be too much influenced by the "reality" of his experiences in hospital. His mental scaffolding is also real and cannot rest on that which it is designed to support.

Time is the great enemy to ideals of education, which, as Dr. Roberts points out, alter but little. The nature of the compromise with time may be changed somewhat, may be improved somewhat in relation to a specific purpose, but it remains a compromise. If a more strictly vocational medical course is instituted, opportunity must be provided for some students to study the pre-clinical subjects more thoroughly, and not only in Oxford.—I am, etc.,

Department of Physiology, Liverpool University. W. H. Newton.

Generous Gifts from American Medical Women

Sir,—In July, 1940, Dr. Esther P. Lovejoy, chairman of the American Women's Hospital Board of the American Medical Women's Association, sent a cheque for $500 to the British Medical Women's Federation to be used "for the relief of civilians in bombed areas." Further sums were promised, and the Federation was asked to administer the fund. Every month a cheque for a minimum of $500 has been received—always for a larger amount during intensified bombing. In all £12,280 will have been sent to us, for we learn that we are to continue to receive $500 a month up to the end of this year. To commemorate VE-Day we received by cable a special thank-offering of $2,000 to be divided between four named hospitals. In her letter confirming this Dr. Lovejoy writes:

> "It has been a great privilege to be of a little help in our common cause. We are very lucky indeed as a nation to have been beyond the reach of bombs this time, although some little ones from Japan are floating in on the breeze to our western coast. The people in England have suffered continuous casualties for five years, and all we could do was to help them a little."

Throughout the war the money has been used to aid cases of special hardship in bombed areas in all parts of Great Britain and Northern Ireland, in hospitals, institutions, and private homes, and we shall continue to help in this way until the fund is closed.

We have endeavoured adequately to express our profound gratitude and appreciation to our medical colleagues in America, but we feel that this outstanding example of generous and practical sympathy on the part of women doctors over-seas deserves to be more widely known. It will be one of the many bonds of friendship between this country and the United States.—I am, etc.,

Janet M. Campbell,
President, Medical Women's Federation.

Rheumatism and Orthopaedics

Sir,—As an orthopaedic specialist who has for some years been interested in the problem of rheumatism, may I congratulate my friend Sir Adolphe Abrahams upon his comprehensive summary of some aspects of this problem and for the constructive proposals that he makes in his lecture entitled "Rheumatism: Postgraduate Instruction" (May 12, p. 671). As this lecture constituted his opening address at the postgraduate course upon rheumatism at the L.C.C. Rheumatic Unit at St. Stephen's Hospital in March of this year, it may be permissible to draw attention to the fact that ever since its institution and throughout the war this unit has given a course of lectures and practical demonstrations upon rheumatism twice a year, under the auspices of the Fellowship of Medicine, to large and growing numbers of postgraduates, including many doctors from the Services.

May I, from personal experience, endorse the remarks of Sir Adolphe Abrahams concerning the importance of avoiding watertight compartments and the great need for a broad knowledge of general medicine by the physicians who will staff the proposed rheumatism centres. At many clinics physical medicine very properly plays an important part, but the physicians are, in many cases, specialists in different highly technical branches of physical medicine. They can hardly be expected to have the broad outlook and general experience of medicine which are so necessary for the preliminary examination and sorting out of the patients. There is sometimes noticed a tendency for them to pin their faith on the methods of which they have special knowledge and experience to the exclusion of other forms of treatment. It falls to the lot of most orthopaedic and general surgeons to operate upon many patients whose chances of complete recovery have been jeopardized by the delay due to a too ready acceptance of the diagnosis of "rheumatism" as a cause of obscure pain. The suggestion, therefore, that a thorough grounding in general medicine should precede the more specialized training in rheumatic diseases seems to me to be admirable. It would be valuable also if, in the staffing of the new centres for rheumatism, the medical director and a good proportion of the medical staff were men engaged in general medical consulting work, preferably at the hospital to which the rheumatism centre is attached.

As an orthopaedic specialist I note with satisfaction the importance that Sir Adolphe Abrahams attaches to the orthopaedic aspects of rheumatism. The large numbers of cases of terrible deformity which are far too often seen testify to the fact that the orthopaedic aspects of rheumatism, and particularly the prevention of deformity, are not yet sufficiently appreciated in many quarters. The formation in 1942 of a Joint Committee of the Empire Rheumatism Council and the British Orthopaedic Association, one of the objects of which is to stimulate closer co-operation between physicians interested in rheumatism and orthopaedic specialists, should do much to remove this reproach from British medicine.

In the average rheumatic sufferer the orthopaedic aspects are never less than equal in importance to and often transcend the purely medical. This particularly applies to chronic cases in which the disease has "burnt itself out" and left stiffness and deformity. Such cases are almost 100% orthopaedic. Yet often such patients are referred to the physician and remain under his care for long periods when what is really required is expert orthopaedic treatment. It is of the utmost importance, therefore, that every new rheumatic centre should include a well-equipped orthopaedic department, and an adequate number of orthopaedic beds should be provided. The orthopaedic surgeon should have regular visiting days: the practice of referring cases to him at some other hospital does not make for the intimate co-operation that is essential. Orthopaedic specialists, as Mr. Capener observes (*B.M.J.*, May 26), occupy a kind of borderland between medicine and surgery, and their province includes not only the treatment but the prevention of deformities. However, at many rheumatism centres, although the advice of the orthopaedic specialist will often be sought in difficult cases, prevention will be the concern of the physician. The latter should be thoroughly versed in the principles of deformity prevention and in the technique of the application of plaster casts, which are often invaluable. He should be familiar with the optimum positions for joints, with methods of extension and injection and other medical orthopaedic measures. When deformity has occurred the advice of the orthopaedic surgeon should be sought without delay; every day that passes makes specialized orthopaedic treatment more difficult and success more problematical. Manipulation of stiffened arthritic joints under anaesthesia is a method of the greatest value in carefully selected cases, but this work is highly technical and *cases requiring manipulations under anaesthesia should always be referred to the orthopaedic surgeon.*

What does Sir Adolphe Abrahams imply by the term "orthopaedic physician" which he prefers to that of "rheumatologist"? I share his dislike of the latter term, which calls to mind the "watertight compartment" mentality, but if the implication is that the "orthopaedic physician" is one who specializes in the prevention of deformity, plaster work, etc., are we not encouraging an even more narrow sphere of specialism? Would such an ultra-specialist be likely to acquire that broad outlook on disease which Sir Adolphe Abrahams in the rest of his lecture so cogently advocates?—I am, etc.,

London, W.1. A. G. TIMBRELL FISHER.

The Edinburgh Outbreak of Smallpox, 1942

SIR,—I was very much interested, in a surprised sort of way, to read the article under the above title by Dr. C. Killick Millard (March 3, p. 304). My surprise and interest were all the greater when I realized that Dr. Killick Millard holds the same epidemiological ideas about vaccination which he apparently formulated about half a century ago.

Dr. Millard's interpretation of his classification of the 36 cases of smallpox which occurred in this Edinburgh epidemic into weeks is, from the epidemiological point of view, quite erroneous. It is well known that it is quite impossible to stop an outbreak of smallpox, where, as practically always is the case, the first cases are picked up in the course of ordinary medical practice, which means that there are a large number of contacts, under a minimum period of six weeks, for these reasons:

1. Protection by lymph vaccination against smallpox cannot be assured unless the individual exposed to smallpox has been successfully vaccinated at least 14 days before such exposure. Hence the occurrence of smallpox among persons vaccinated (even quite successfully) *after* exposure.
2. It takes at least one week even in the best organized of communities for a sufficiently large number of persons to be successfully vaccinated (that is, to develop an immunity against smallpox)—and it must be remembered that quite a large proportion of persons vaccinated do not "take" on the first vaccination or revaccination as the case may be—to put an effective check on the spread of the outbreak.
3. After this period sporadic cases of smallpox must be expected for a further minimum period of three weeks.
4. It is not necessary for a particular population to be 100% successfully vaccinated to stop an outbreak of smallpox in a community provided with doctors on the lookout for smallpox, ambulance, isolation hospital, and disinfection facilities, as Edinburgh is.

Of course, if the first case is discovered early—say on a train or in a ship—vaccination of all immediate and possible contacts may be all that is necessary; but I consider that the 1942 Edinburgh outbreak was handled in the only way possible, and because of the correct approach to it by the city health authorities it went "according to plan." That is to say, 25 cases occurred up to date when mass vaccination was begun—i.e., during the first week of outbreak as diagnosed—9 cases occurred during the immunizing period of 3 weeks, and only 2 cases during the sporadic period. The deaths from postvaccinal vaccination are regretted, but the deaths from smallpox would have been very much greater had not the population of Edinburgh been quickly and adequately protected by the measure of mass vaccination undertaken by the health authority.

The statement that "the less vaccination the better so long as we can achieve our object, which is effective control of smallpox," is quite meaningless, and one which no health officer in his right senses would even for a moment consider. The psychological effect of mass vaccination is, as Dr. Millard says, an important factor. My experience has been (and this is pretty general) that a good "take" has a marvellous effect on settling the nerves of a jumpy community, the fear of contracting smallpox being infinitely greater than the possible discomfort of a sore arm (even if it puts the patient to bed for a few days) or even of the possible contracting of post-vaccinal encephalitis.

Of course, there are always those unhappy persons who regard as a species of personal martyrdom what ordinary people take in their stride, and whose unreasoning and ignorant selfishness makes them perfectly willing to shelter behind the protective care of others. I have yet to see the conscientious objector to vaccination offering to nurse in a smallpox hospital or even to help vaccinate smallpox contacts. These peculiar gentry always manage to keep well away from danger but are loudest in their criticism of those who face it!—I am, etc.,

Public Health, Union of South Africa. A. L. FERGUSON.

Wanted: Prophylactic Vaccine for Typhus

SIR,—In connexion with the danger of an epidemic of typhus arising as a sequel to the terrible war that has just been waged in Europe, I would like if some of the readers of your widely circulated *Journal* could inform me what exactly is the best prophylactic for typhus, together with the name and address of the manufacturers, the best method of administering the prophylactic, and the actual cost. This information is necessary so that some of the prophylactic may be obtained for the County Louth Health Department for use in the event of an outbreak.

There has, I may add, been only one outbreak of typhus in the past 20 years in County Louth, which occurred in 1939. There were five cases in all and three deaths, giving a case mortality of 60%, which is something close to the usual mortality rate met in most outbreaks of typhus exanthematicus. The amazing feature about the County Louth outbreak of typhus (1939) was that it was proved pretty conclusively by the then M.O.H. for the county, together with an inspector (medical) from the Department of Local Government and Public Health, that the cause of the outbreak was the wearing, by those attacked, of clothes which they had taken from an old trunk where they had been stored for some time and which belonged to people who experienced an attack of typhus a considerable period before 1939.

With regard to the suggestion that rickettsiae bodies survived for a long time in the clothes contained in the trunk, thus bridging a prolonged interval between two outbreaks, is this possible? Or is it more likely that there might have existed a reservoir in the domestic rat, transmission from rat to rat being by the agency of the rat flea, and when the flea was hard put to it to find a new host he bit man, and in this way the outbreak occurred?

So far as I am aware the prophylactic vaccines used in typhus are: (1) that prepared by Durand by propagation on the mouse lung of the rickettsiae; (2) Weigl's vaccine, which consists of killed rickettsiae, prepared by injecting the anal aperture of the louse with *Rickettsiae prowazeki*, and allowing the organisms to multiply for a week, the lice being fed during the intervening period on immune subjects: the lice are then crushed in phenolized saline; (3) vaccine prepared by Cox by growing the rickettsiae on the yolk sac of the developing chick embryo.—I am, etc.,

Public Health Department, Dundalk, Eire. JOSEPH FAHY.

Attenuation of Measles

SIR,—It has been said that the age of 5 years forms a sharp dividing line between measles as a menace and measles as a nuisance, and for the general practitioner, who, in the main, has to deal with epidemics of measles, the very vital question arises whether there is a practical method of attenuating measles in the dangerous period up to the age of 5. In describing such a method, which is simple and often practicable, I am fully aware of the vast amount of work that has been done in the prevention of measles by convalescent serum, pooled adult serum, and serum globulin, but a remark recently in the *Journal* (March 3, p. 300) leads me to stress the importance of the following method, for which, of course, I do not claim originality.

In a general way the children of a family escape measles until the eldest goes to school at the age of 5. Within two or three years this child usually contracts measles. It has been my practice now for some years to inject 8 to 10 c.cm. of whole blood from one of the parents intramuscularly into the younger child or children. After a considerable experience of this method I am prepared to say that one can look forward with confidence to an attack of measles in the younger children so attenuated as to be trivial to a degree. The cough is slight or absent, as is the febrile state, the rash is trivial and fleeting, there is no conjunctivitis as a rule, and it often seems a farce to keep the patients in bed, if indeed they so consent. Admittedly, the degree of immunity conferred varies, but that matters little if attenuation is considerable. A few points deserve mention:

(1) The dose of blood should be given to the juniors as soon as the rash occurs in the older child; 8 to 10 c.cm. is adequate. (It used to be said that 10 to 20 c.cm. was necessary.)

(2) The donor parent obviously must have a definite history of measles.

(3) No blood grouping or matching is necessary.

(4) In a family, the very high susceptibility to measles is here an advantage. One *knows* when the attack is coming in the inoculated though the incubation period is prolonged.

(5) Lasting immunity is believed, on good authority, to follow an attenuated attack.

(6) It is sometimes possible to use some whole blood from an older child previously protected by an attack. In such a case 5 c.cm. or less should be given. It is more likely to cut out the attack altogether.

(7) The great advantage of whole blood is its simplicity and its immediate applicability, and, further, it is much more likely to secure attenuation only than convalescent serum. I do not, of course, deny the value of complete prevention in certain cases.

(8) There has been no general reaction to the blood injected, and only slight local tenderness.

During the epidemic since October last I have notified 92 cases of measles. I have injected blood in 25 contacts: in 23 cases from parents, in 2 from protected older children of the family; 14 had definite but much-attenuated measles. The most pleasing feature was that the cough was absent or slight, except in a child subject to croup, who developed croup. One child had a profuse rash and conjunctivitis, but a trivial illness and coughed for one day. Eight children had no attack; four of these were under 1, and may not have had true exposure to infection. The other three ought, by all the rules, to have had an attack.

During recent weeks letters have appeared in the *Journal* advocating the routine use of the sulphonamides in uncomplicated measles at the outset. The indiscriminate use of such potent drugs, not incapable of doing harm, in a brief self-limited febrile illness where defervescence occurs spontaneously in a few days, hardly appears in accord with sound therapeutic principles. It is rather like cracking a nut with a sledgehammer. Surely, it would seem more rational to reserve these drugs for possible complications. The reasons given for their routine use appeared singularly unconvincing, especially as, as Dr. L. G. Jacob pointed out, no attempt seems to have been made with controls.

In this connexion it would not seem out of place to mention that in my 92 cases the four complications were two cases of acute laryngitis, one bronchopneumonia, one possible case of glandular tuberculosis (not proved). There were no deaths. I would make no claim, of course, to any special treatment except in those cases where attenuation was secured.—I am, etc.,

London, N.W.7. A. H. MORLEY.

Artificial Respiration in the Newborn

SIR,—The need for artificial respiration in the newborn is an emergency which faces all doctors with fair frequency. The method of applying the mouth to the infant's mouth with a napkin intervening is commonly used. With this method one has assurance that air is really entering the lungs of the child. The method can be more conveniently applied by means of a small (infant-size) anaesthetic facepiece, with a flexible tube attached, the end of which can be held in the operator's mouth. I have had one of these made with a metal mouthpiece which can be easily held by the teeth.

This contrivance has the advantage of enabling the operator to stand in a comfortable position and to observe the patient. The mask, which has a pneumatic-cushioned edge, is held in close apposition to the child's face over mouth and nose. Needless to say, before the apparatus is used the presence of mucus is dealt with in the proper manner. To facilitate drainage this method can be applied with the child in the head-down position.

I should be interested to learn if this very simple idea has been found useful in the experience of others.—I am, etc.,

Rhayader. J. POOLE.

Painless Childbirth

SIR,—We have long felt that experienced obstetricians should be grateful to Dr. Grantly Dick Read for his valuable contributions to an understanding of the care and control of a woman's emotions before and during labour. We would like, however, to comment on two of the statements in his letter in the *Journal* of June 2 (p. 784).

He asks: "Do scientific and biologically minded men, even though they have no particular philosophy, really accept without question that the most desirable experiences of a woman's life and her obvious natural urges are rewarded in their ultimate perfection by an ordeal of pain and danger?" In our opinion the answer is unquestionably, Yes; and this view is upheld by a study of reproduction throughout the whole animal world. So far as we know no species of mammal is immune from the dangers of reproduction. Anyone who has witnessed a cow or mare in the process of giving birth to its young would never question whether it is a painful process, and a study of the evolution of reproduction will reveal abundant evidence that Nature is meticulously careful with the preservation of the species while she is often ruthless with the parent. Surely it is more true to say that pregnancy is a healthy process from the point of view of the race rather than of the individual. When the mammalian scale is reached and the egg is retained in the maternal body during its development, it is hardly surprising that a strain is thrown on the maternal organism, which now has to supply all the needs of the foetus.

The second point we wish to comment on is what Dr. Grantly Dick Read considers to be normal labour. We have all heard of the primitive races to whom childbirth is almost a painless function. But these people belong to a pure racial type in whom the shape of the head and the types of pelves are almost a constant. We, however, have to deal with a very hybrid race. Between the various classical types of pelves, we meet with every graduation and combination of types. And, of course, the foetal head will show an almost equal variation of shape and size. It is hardly surprising, therefore, that the slight deviation from normal is a very common occurrence. We presume that Dr. Grantly Dick Read would not expect such cases to be "quite painless."—We are, etc.,

R. CHRISTIE BROWN.
London, W.1. E. R. REES.

Women in Labour

SIR,—A careful reading of the correspondence on women in labour added to one's own experiences of maternity work in a rural practice, where time is always pressing owing to the distances that have to be travelled, leads to the conclusion that some 90% of women in labour desire and require analgesia terminating in anaesthesia. This, to my mind, can only be achieved, short of the introduction of some new drug, by either: (1) the invention and introduction at a reasonable price of some new mechanical inhalation machine which is 100% foolproof for self-administration under a nurse's supervision, as is the Minnitt, and which is, unlike it, 100% effective in 100% of cases; (2) the attendance for a minimum of 8 hours of an anaesthetist.

As to (1), it should not be beyond the wit of man to produce such a machine sooner or later. But as to (2), there are two governing factors that for many years seem insuperable: (i) Medical man-power. (ii) The fees that any anaesthetist would rightly require for such attendance would be beyond the reach of the vast majority of the patients who require his services, and would also preclude any national maternity service from employing practitioners in such capacity, for obviously no man could average more than 5 to 6 cases weekly.

Only in one way can these two apparently insuperable difficulties be solved, and that is by the recruiting and training of a body of "unqualified" anaesthetists for maternity work. There are many branches of medicine where doctors rely exclusively on such medical auxiliaries, without whose work much could not be accomplished—such as laboratory and radiography technicians—and once the inbred conservatism that is always manifested towards the unqualified be overcome, there is nothing revolutionary in the idea, except, perhaps, the ends to be gained.

After a training period of 2 to 3 years, which should include a good grounding in biology and physiology with a far longer practical training in anaesthetic administration than the medical student ever obtains, there would be to hand a body of auxiliaries available for the long hours of attendance requisite in maternity work, and who, owing to the much shorter training period undergone as compared with the doctor, would be willing to receive fees at a much lower rate than the qualified anaesthetist. One proviso I would add—namely, the administration of such auxiliaries be limited entirely, to inhalation anaesthesia and to maternity work alone.

To the many obvious and justified criticisms that will and can be levied against this suggested scheme, three questions can be posed at once: (1) How else is the demand of women in labour to be met? (2) Does not the competence attained by many district midwives with "rag and bottle," after somewhat sporadic training by the local practitioner, augur well for what could be done after 2 to 3 years' special training? (3) Who, with the exception of the specialist anaesthetist, gives a better gas-and-oxygen anaesthesia than the average dentist?—I am, etc.,

Lincoln.

SIDNEY WRAY.

SIR,—Some years ago now a mother nearing the end of her second labour told me that in her first labour I had given her chloroform, and asked that she should feel all that a woman could experience on this occasion. She told me later that the feeling of the child slipping out of her was the most satisfying thing in her life. Some time ago a woman consulted me about the sickness of pregnancy, and when I told her that this was out of date now, she replied that she had read a book which said pregnant women were sick, so she was. I told her that happy pregnant women were not sick, so she stopped being sick at once.

The point I am making is that mind affects matter. The doctor who says "the penalty for a normal labour is having to go through hell unaided," and talks about labour as "an unforgettable nightmare," will surely have a lot of troublesome women who need a whole lot of anaesthetics and analgesics. Surely the average woman, if correctly trained mentally and if protected from "folk," is well able and willing to deal with an average labour without a lot of analgesics and anaesthetics. This is not sadism, but common sense and experience. If a woman is unduly sensitive to pain, or if the labour is abnormal or prolonged, then help will be required. Pethedrine fills a gap in our needs, and is worthy of wide recognition and use.

But I cannot help thinking that the secret of easy midwifery is small babies. I have found the induction of labour by castor oil, quinine, and pituitrin safe and good; but it does not always work. One hesitates to rupture the membranes without some very definite indication for induction. If, therefore, someone can discover for us something that will start labour off easily, surely, and safely he will be doing the cause a great service, for then we need have no large babies and less tiresome midwifery, and, incidentally, there will be less need for analgesics and anaesthetics in labour.—I am, etc.,

Rotherham.

ERIC COLDREY.

SIR,—I read the letters on women in labour with interest and would like to add my word to that of Mrs. Jean Sutton (June 9, p. 823) on the subject of normal labour.

Before the birth of my first child, 21 months ago, I read *Revelation of Childbirth*, by Grantly Dick Read. I have had no medical training, but I concluded that his arguments were sane and sound. Regular and recognizable contractions began at 5 p.m. on the day my baby was due. They caused me no pain, and I was unafraid. At 10 p.m. I retired, and, relaxing completely, fell asleep. I awoke at 4.30 a.m. with a strong contraction, and the midwife was sent for. Contractions were then occurring at four-minute intervals and the midwife was puzzled at my "light-heartedness." At about 5.45 a.m. I experienced some discomfort with each contraction. On entering the second stage and pushing hard, however, the discomfort ceased entirely. My baby was born at 6.40. Unfortunately the practitioner who attended me mistook my refusal of anaesthetic to be due to some religious obligation and thought I was intent on "suffering unnecessarily," so that after a rather undignified battle, during which the head crowned, I was obliged to breathe through the wretched chloroform mask.

My second child is due in a month's time. I am not a brave woman, neither am I insensitive to pain (a visit to the dentist makes me feel sick with apprehension and very dry in the mouth), but I look forward with great joy not only to seeing and holding the new baby, but to bearing it. I think that to a woman who has been instructed on the conduct of labour and is free from fear normal childbirth is a supreme experience, and I appeal to all doctors to help, and not to hinder, more women to find it so.—I am, etc.,

GWENDOLINE ROWNTREE.

Caudal Analgesia

SIR,—I have just received by air mail a cutting of Prof. F. J. Browne's interesting letter on continuous caudal analgesia (May 26, p. 746). I would like, if your space permits, to make a few further observations.

First, it is consoling to find that in this quarter obstetric analgesia is being followed and carefully assessed. On the other hand Prof. Browne quotes in support of his views and presumably therefore concurs with this statement: "The use of such a hazardous procedure . . . to relieve the *usually innocuous pains of labour* [my italics]." This remark so well illustrates the point I wish to make in the opening paragraph of my original letter that further comment (except perhaps from those who have borne children) is superfluous.

Criticism of the alteration in mechanism of the labour leading to a more frequent use of forceps is, of course, valid; it should be mentioned, however, that in the great majority of cases this involves only the low outlet forceps to bring the head over the perineum. This procedure is, I believe, devoid of risk to mother or baby under proper conditions. Dr. Hingson has emphasized (accounts in the popular press very naturally do not represent his views) that this method is applicable to patients under good hospital conditions, and then to only 75% or so of these for this and other reasons. This proportion in a widely constituted and well-equipped maternity service would represent a very large number of patients benefited.

It is not denied that fatalities have occurred, as evidenced by the cases referred to by Prof. Browne; the salient question is, surely, whether these were avoidable and could be corrected by variation of the technique, or intrinsic in the method—e.g., the case of sepsis, an obviously controllable factor. Reference to the inception of any method of anaesthesia will lead to at least as startling an array of discouraging facts. More difficult to explain than these early mishaps would be the figures, which I shall hope to provide, of the latest large series without them, if one is to start with the assumption that the method is dangerously unsound.

As my address and the demobilization plans of the Navy will explain, I am not in a position to provide the references for the positive side of the picture immediately, but I hope to obtain them before they are too late to be of interest. I should be very pleased to have Prof. Browne's further comment on them; my own experience is so small and my ignorance so large that I cannot without these references offer him any more immediate "cannon fodder."—I am, etc.,

T. B. FITZGERALD,
Surg. Lieut.-Cmdr., R.N.V.R.

Obstetric "Specialism"

SIR,—I fear to tread the path where the controversy on women in labour has led, but I must agree with the principles enunciated by Dr. E. K. Mackenzie (June 9, p. 823), where he says "it would be a good thing if many of these 'Fellows' spent two or three years under the supervision of a competent G.P. before being permitted to proceed to hospital for special experience." Criticism of our colleagues and institutions is sometimes unpleasant, but it is frequently healthy, helpful, and democratic; and so I agree with his stricture concerning "the variety of stillborn infants, etc." While at probably the best-known maternity institution in the world I did a short course in midwifery a few years ago, and I witnessed the arrival of stillborn babies, who, in my judgment, would have been saved by a low-forceps delivery; but this would have increased the forceps rate, the record for which low rate was held by another institution.

I disagree, however, when he says that midwifery "is that department of medicine where diagnosis is easiest." Surely not! This is too sweeping a statement.—I am, etc.,

Swansea.

L. W. HEFFERMAN.

Sex Dispersion of Intelligence

SIR,—On reading the article on the difference between the sexes in dispersion of intelligence by Dr. J. A. Fraser Roberts (May 26, p. 727) I recalled some investigations in America that were carried out by Prof. E. L. Thorndike over 40 years ago. His conclusions were identical with those of Dr. Fraser Roberts—i.e., that while there was no marked difference between the average intelligence of boys and girls the individual differences in boys were greater than those in girls, and that greater extremes of brilliance or dullness were to be found in boys than in girls. I quote from the only publication that I remembered:

> "Such statistics as I have been able to secure give measures in 26 objective tests, with from 100 to 1,500 individuals, and in 25 records of school marks with from 60 to 1,000 individuals" (page 114).
>
> "These facts make it extremely probable that, except in the two years nearest the age of puberty for girls, the male sex is slightly more variable. From the time of puberty for boys to maturity this difference seems to increase rapidly . . . it proves conclusions about the capacities of the sexes in general based upon the comparison of the extremes in both cases to be certainly risky and probably false. For instance, suppose that we picked out the hundred most gifted intellects from a million men and a similar 100 from a million women. Even if in both sexes the average intellectual ability was identical we should, if the variability of women was 95% of that of men, probably find no woman of our hundred who was equal to any one of the 100 men" (p. 115). (*Educational Psychology*, by Edward L. Thorndike, Lenke and Buchner, New York, 1903.)

—I am, etc.,

London, S.W.3. MORRIS CUTNER.

Electro-convulsive Therapy Apparatus

SIR,—Perhaps you will permit me to make a few technical comments on the small portable electro-convulsive therapy apparatus described by Dr. A. Spencer Paterson (May 12, p. 666).

In *Recent Advances in Neurology and Neuropsychiatry* (London, 1945) the authors state with reference to E.C.T. apparatus that "any apparatus constructed on sound electrical principles that can deliver exactly the required voltage for an exact period of time measured in 1/10th of a second is suitable for the work." They might have added to advantage that an E.C.T. apparatus, as is the case with all electro-medical apparatus, should have a margin of electrical safety to justify the use of the term "foolproof." It is because, in our opinion, the apparatus described by Dr. Paterson falls down on all the above-mentioned desiderata that I venture to trespass on your space.

It seems to me that the designers have sacrificed efficiency and safety to considerations of weight, space, and cost. The following are the main points which demand criticism:

1. The earthing of one side of the patient is very unwise, as Leduc pointed out some 30 years ago. Earth-free patients' circuits have been stipulated by electrologists as the only reasonable security against accidental electrocution due to faults, and it is not for nothing that this practice has been adopted by specialists for so many years now.

2. A good transformer delivering the calibrated voltage accurately on load has to be built on liberal lines if it is to avoid bad regulation, and the tempting overall weight of 11 lb. implies an insufficient transformer core. Besides, to cover 70 to 150 volts in only seven steps is, in my opinion, too coarse a control. Moreover, with good voltage regulation very much shorter dosages than are possible with this clockwork timer should be used, 0.1 to 0.3 sec. to make good E.C.T. practice. Times exceeding this at voltages between 70 and 150 represent an overdose on 95% of cases and invite convulsion trauma.

3. The omission of a time-loaded fuse in the patients' circuit seems to invite trouble if any faults are encountered in the set-up of patients' leads.

4. As regards the timer, clockwork devices of this type suffer from fatigue and are unsuitable for the short timing necessary, and, moreover, the range should extend from 0.1 sec. An electronic or condenser switch with an interlock to prevent the possibility of prolonged shock with its fatal complications is the correct method of approach.

5. The threshold of sensibility for the most sensitive patients is about 200 microamps A.C. 50 cycles. Why, then, use currents for measuring up to 1,000 microamps? And why not use a straight-line calibrated bridge circuit which is much easier to read?

The observations are made in view of the fact that few psychiatrists who make good and legitimate use of E.C.T. have much knowledge of the electrotechnical principles involved in the construction of the apparatus which they employ. It is important, then, to have guarantees of safety, accuracy, and efficiency.—I am, etc.,

D. P. MEDHURST, S.M.I.E.E.,
Member of the Electrical Power Engineers Association.
London, W.C.1.

Aborting the Common Cold

SIR,—The method tried by Dr. W. Edwards for aborting colds by inhaling chlorine gas (June 2, p. 785) seems to be useful mainly for colds starting in the nose. But for one common site of onset, the pharynx, which is injected and feels "sand-papered," nasal inhalation is not likely to be effective. This type may respond to frequent paintings with antiseptics, or with plain glycerin—also effective sometimes for a post-nasal onset. The rare type beginning with a painful area in the trachea just above the manubrium I have found sometimes can be aborted by a few treatments with short-wave diathermy to the neck. Patients have their own remedies, as a patient I knew who could almost always abort a cold by going to bed and taking a dose of warm castor oil; and another who could cure his colds in one day by sitting before a very hot fire (whatever the weather) and drinking several bottles of beer!

One of the simplest and surest remedies for colds beginning in any site is the one I described in the *Journal* of March 5, 1932 (p. 449). The essential is to gargle with water as hot as can be borne for a few minutes every quarter of an hour or so for an hour or two. Antiseptics may be added to the water, but the heat is the essential. It acts probably by activating the lymphoid immunity tissues in the tonsil and Waldeyer ring. It is also a help if, at the times of gargling, the arms up to the elbows are placed in very hot water for a few minutes (and the feet, if they are chilled). Adjuvants are hot drinks, nasal sprays, or snuffs, and a minimal erythema dose of ultra-violet light to the chest, back and front.

Colds are like fires: the easiest and most certain time to put them out is at the earliest onset, but prompt action is essential.—I am, etc.,

London, W.1. J. H. DOUGLAS WEBSTER.

SIR,—I am very interested in Dr. W. Edwards's discovery (June 2, p. 785) of treating catarrhal respiratory conditions with gaseous inhalants of acid character. A similar treatment was well known about twenty years ago in Germany, under the name of Prof. Kuhlenkampp's acid therapy. The professor, a non-medical man, had found that the labourers in his factory, where a certain amount of hydrochloric or sulphurous acid was in the air, did not suffer from affections of the respiratory tract. This was ascribed to the acidity of the air. The method was subsequently elaborated; a whole book was published about it with many diseases on the list, but as it required an inhalation chamber it was not easily applicable in private practice. If Dr. Edwards's method be usable anywhere it might be helpful in a number of diseases.—I am, etc.,

Bristol. B. BANETH.

Intestinal Obstruction from Ingested Dried Fruit

SIR,—The five cases of intestinal obstruction caused by ingested fruits reported in the *Journal* of May 26 (p. 734) encourage us to ask for the hospitality of your columns for the report of this case of obstruction.

A stout woman aged 59 years, a typical "Piccadilly flower girl," was admitted complaining of abdominal pains, vomiting, and constipation of two days' duration. Her tongue was dry, furred, the abdomen was distended, with no localized tenderness. There was a firm, irregular scar in the right lower abdomen after appendicectomy 32 years ago; provisional diagnosis was made of small-intestinal obstruction due to adhesions. At operation some large adhesions were found and divided, but this did not reveal the actual site of obstruction. Systematic inspection revealed a firm, yellowish, ovoid mass, measuring 6½ cm. by 2¼ cm., obstructing the lumen of the ileum about two feet from the ileo-caecal valve. Its removal led to relief of obstruction and uneventful recovery. The foreign body proved to be half a dried peach, which had been soaked in water overnight but which had been swallowed without mastication.

We consider that, owing to the increasing consumption of dried fruit, the general public should be advised to prepare and to masticate them properly; and in view of the number of cases already reported, this aetiology of acute intestinal obstruction should be more readily considered in the differential diagnosis.

Our thanks are due to Mr. K. F. D. Waters and to our medical superintendents for their advice and permission to publish this report:—We are, etc.,

J. L. Coles.
St. Mary Abbots Hospital, Kensington, W.8. A. Beck.

Belsen Camp

Sir,—My attention has been drawn to an article in your issue of June 9 (p. 814). In the interest of accurate recording it is felt that Dr. Collis should be aware of the following facts:

(1) The typhus area including Belsen Camp was uncovered by the 11th Armoured Division during April 15 and not April 17 as his account suggests.

(2) The first individual to enter the camp was the Divisional A.D.M.S., Col. D. Bluett, who went in about midday on April 15.

(3) The first medical unit began work in the camp at approximately 4 p.m. on April 15. This was the Divisional Field Hygiene Section.

(4) Incidentally this unit was the only medical unit working there until April 18. It spent the first two days completely within the wired enclosure, and during the first 24 hours the S.S. men were still in control of the camp.

(5) It was due to the foresight of Col. Bluett that supplies of A.L.63 and disinfectant were available for this initial effort. Up to the afternoon of April 18, when another Field Hygiene Section came up, some 15,000 inhabitants of the camps had been deloused.

(6) The fact that the 11th Armoured Division provided some troops, water-carts, the greater part of its hygiene section, and its whole laundry and bath unit, while active operations were being carried out, is deserving of mention in any account of Belsen.—I am, etc.,

F. R. Waldron,
76 (Br.) Field Hygiene Section, B.L.A. Major, R.A.M.C.

Alien Doctors

Sir,—Major Stallard in his letter voices the opinion of all the doctors with whom I have personally come in contact during the past few years. I do not exaggerate when I say that the position with regard to what Major Stallard euphemistically refers to as Central Europeans is galling. I have myself offered my services, free and without prejudice as to their continuation after the war, to two hospitals in the Midlands. One of these did not deign to answer my letter. By the other I was told that the acceptance of my offer might prejudice the position of returning officers. Meanwhile "Central-European" doctors and other strange importations were given the jobs. *Quousque tandem ?*—I am, etc.,

Kingswinford. Wm. A. O'Connor.

Oxford and Cambridge University Parliamentary Constituencies

Sir,—In order that as many electors as possible may be able to register their votes at the forthcoming election, I shall be obliged if you will allow me, as Registration Officer for the Cambridge University Constituency, to draw the attention of the electors to certain points of procedure. It should be noted that what follows does not apply to persons for whom proxies have been appointed, or to those who have applied for registration as Service postal voters.

Voting will not be in person, but by means of voting papers issued by the Vice-Chancellor as Returning Officer. They will be posted to electors by June 29. It will help to secure the earliest possible delivery of voting papers if every Cambridge University elector who has reason to think that his permanent address is not that which appears in the University Parliamentary Register will write at once to me at the University Registry, Cambridge. An elector who wishes to vote and has not received a voting paper by July 3 should write to me immediately giving the address to which a voting paper is to be sent to him.

I have been asked by the Oxford University Registrar to say that a similar procedure should be followed by electors of the Oxford University Constituency. They should communicate with him at the University Registry, Oxford.—I am, etc.,

W. W. Grave,
Registrary, University of Cambridge.

Obituary

N. BISHOP HARMAN, F.R.C.S.

We have received the following tribute from W. A. D.:

The death of Mr. Bishop Harman removes one to whom the nation owes a debt of gratitude for his eminent services in promoting the care of the eyesight of the population. It was 45 years ago at the beginning of the present century that Mr. Brudenell Carter, after a visit to some of the London Board schools, pointed out in a letter to the *Times* how much of the efforts of the teachers was nullified by widespread unrelieved defect of vision among the school-children, many of whom appeared to be semi-blind. This letter produced notable results. The School Board in 1901 instituted the regular testing of the children's eyesight by the teachers and appointed six "oculists" to supervise the tests. Mr. Bishop Harman was one of the six. Thus began an association with the Education Authority which produced far-reaching and beneficial results. With the sympathetic support of Dr. James Kerr, who was later appointed chief medical officer to the Board, Harman proposed numerous reforms which were duly carried out. Fine work hitherto practised in infants' schools was abolished; so were slates and pencils. Sewing by artificial light in girls' departments was prohibited.

When the London County Council took over the work of elementary education Harman was appointed ophthalmic consultant. The presence in the ordinary schools of a number of children with high myopia for whom the ordinary methods of education were harmful led Harman to the conclusion that it was necessary to establish separate classes or schools with a curriculum and teaching methods specially devised to meet their needs. The first such school was established under Harman's supervision in 1908; and within a short time the whole of London was provided with special "myopic" schools, or, as they were later and better called, "sight-saving" schools. Harman himself devised special desks and apparatus for these schools, and it was due to his energy and drive that they became successful. His methods were adopted in large provincial centres and were followed enthusiastically by our transatlantic cousins. The lighting, both natural and artificial, of schools of all types was also a question which Harman made his own, and he was instrumental in securing the adoption of greatly improved standards. He also paid close attention to the type of school books, for which he formulated standards which were largely followed in school practice.

There is thus no part of the field of ocular care which Harman has not illuminated by his genius and knowledge, and it is not too much to say that the diminution of blindness and partial blindness from preventable causes in childhood has been greatly helped by his work.

The death, at the age of 59, of Robert Sharp Lawson, F.R.C.S., senior surgeon to the Leicester Royal Infirmary, has deprived his colleagues of one whom they regard as one of the most distinguished surgeons who has ever served on the staff of that institution. Born at Blackford, Perthshire, he received his medical education at Edinburgh University, where he had a brilliant career. After qualifying he became house-surgeon to Sir Harold Stiles, for whom he acted for a time as private assistant. He became R.S.O. to the Dreadnought Hospital, Greenwich, relinquishing that post to join the Navy, in which he served from 1914 to 1918. After the war he spent some months working with Sir Robert Jones in Liverpool, thereby laying the foundation of a lasting enthusiasm for orthopaedic surgery, which was to prove of signal benefit to the hospital where his life's work was to be done. He was appointed to the Leicester Royal Infirmary in 1919, and quickly established a reputation, both in general surgery and in orthopaedics. He was really the founder of the orthopaedic and fracture service which has developed into such an important and efficient department. He was an original member of the Provincial Surgical Club of Great Britain, of which he was secretary for two years and in which he always took a keen interest. His colleagues and the medical profession over a wide area, and very many house-surgeons who had the privilege of working with him, will always remember him as a most gifted surgeon and a valued consultant; but they, and many surgeons all over the country, will also particularly recall his courteous and polished manner and his remarkable gifts of friendship and hospitality. Shortly before the war an attack of coronary thrombosis compelled him to rest completely for six months. He returned to work at the outbreak of war with restored health and vigour, and, though he must have been well aware of the risk of a recurrence, he faced and coped with the increased work and responsibility of the war years.—T. C. C.

Mr. Claude Douglas, consulting surgeon to the Leicester Royal Infirmary, died at Oxford on June 9 in his 93rd year. The son of James Douglas, M.D., he was born at Bradford in August, 1852, and studied medicine at St. George's Hospital, qualifying in 1873. He obtained the F.R.C.S. in 1888, after having been surgeon to the Leicester Provident Dispensary for seven years. Mr. Douglas was honorary surgeon to the Leicester Royal Infirmary from 1886 to 1911. During the last war he served as lieutenant-colonel, R.A.M.C.(T.F.), on the staff of the 5th Northern General Hospital, Leicester. He held office as president of the Midland Branch of the B.M.A. in 1901 and as vice-president of the Section of Surgery when the Association met at Leicester in 1905.

Dr. Charles Vincent Dingle, who died on June 7, was M.O.H. for the county borough of Middlesbrough from 1898 until 1936, during the period when the foundations of the health services of the town were being well and truly laid. His introduction to Middlesbrough was at the time of the virulent smallpox epidemic which, raging there during 1897 and 1898, attacked 1,405 of the townspeople. His previous experience on the staff of the public health department of the City of Newcastle stood him in good stead during this difficult period. He became one of the foremost authorities on smallpox in the North of England and was the author of many special reports on vaccination and smallpox. He was appointed medical officer to the Tees Port Health Authority in 1904, and became the town's first school medical officer in 1908. During his term of office Dr. Dingle tackled the high infantile mortality with the causative bad housing in Middlesbrough with great vigour and determination, and was instrumental in carrying through, against much opposition, some extensive slum-clearance schemes. He saw a large part of the town converted from privy middens to the water-carriage system of sewage disposal, and also established the maternity and child welfare services on a most satisfactory basis. On his retirement in 1936 he had seen the public health department grow, through his guidance and inspiration, into a very important and vital factor in the life of the town. He was well loved by his colleagues and staff for his kindly and courteous manner, and nowhere was his cheerful personality more in evidence than in the various social functions in the hospitals and other institutions under the control of his department.—T. L. H.

Dr. Thomas William Higgins Burne, of Chesham Bois, Buckinghamshire, late senior surgeon, Federated Malay States, died suddenly on June 2, aged 65. He graduated B.M., B.S.Lond. in 1908 from St. Bartholomew's Hospital and went to Malaya, becoming medical officer in charge of the General Hospital, Johore, and chief surgeon, Selangor. This title was altered to chief surgeon, F.M.S., in 1927 and he was made senior surgeon in the following year. He married Dr. Catherine Violet Turner, and after returning to England became honorary medical officer to Chesham Cottage Hospital and medical officer to the Amersham Institution. He had been a member of the B.M.A. since 1910.

Dr. Thomas Fernandez died suddenly at his home in Sutton Court Road, Chiswick, on June 5. After spending his early youth in India and Ceylon, Dr. Fernandez studied medicine at St. Catharine's College, Cambridge, and graduated M.A. in 1919. He continued his medical studies at Guy's Hospital, and took the diplomas M.R.C.S., L.R.C.P. in 1920. He won the University cue for billiards while at Cambridge, and was an excellent golfer. He leaves a widow, Christine, daughter of the Rev. James Mayo, D.D., of Warkworth Terrace, Cambridge, and a son, John Anthony, a young man of great promise, who, after a period at Trinity College, Cambridge, is engaged on specialized research for the war.—C. B. C.

Dr. Roger Bullock, of Stratford-on-Avon, late surgeon lieutenant-colonel, Warwickshire Yeomanry, died on June 9. He was born at Warwick on Nov. 7, 1862, son of Thomas William Bullock, M.R.C.S., and from Rossall School went to Queen's College, Birmingham, with an entrance scholarship, in 1881. He qualified M.R.C.S. and L.S.A. in 1887, and was then house-surgeon at the Birmingham General Hospital. Returning to Warwick he became medical officer to the local dispensary and cottage hospital and also to the Heathcote and Fosse Hospitals under the Warwickshire Joint Hospitals Board. He served for a year during the last war with the Warwickshire Yeomanry in the Egyptian Expeditionary Force, was mentioned in dispatches, and received the Territorial Decoration. Later he became Deputy Commissioner for Medical Services for the Warwickshire area under the Ministry of National Service. Dr. Bullock joined the B.M.A. in 1890 and was emergency officer for Warwick and Leamington 1938–40. He was a J.P. for the county and borough.

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

The following candidates have been approved at the examination indicated:

Final M.B.—*Part I (Surgery, Midwifery, and Gynaecology)*: G. S. Andrew. J. Armstrong, T. W. Backhouse, G. B. Barker, J. C. Bayliss, A. M. H. Bennett, A. V. G. Bibby, M. Binnie, J. E. Blundell, B. H. Brock, A. R. Buckley, E. H. W. Burt, F. J. Conway, M. G. Cox, D. G. Davidson, W. H. Davies, J. A. R. Debenham, J. A. Dew, J. M. Drew, J. O. P. Edgecumbe, E. Ellis, R. H. Ellis, R. Finlayson, J. F. Fisher, A. E. Flatt, A. L. Furniss, D. A. G. Galton, J. M. Garratt, E. B. Gethen Smith, J. H. H. Glyn, J. H. Gough, A. W. I. Hall, D. Hamilton, R. Hodgkinson, G. F. Jolly, W. R. Juckes, C. H. Kinder, P. K. Ledger, D. W. L. Leslie, A. H. Littlewood, A. B. McGrigor, C. McIver, J. McMillan, P. N. Magee, N. B. Malleson, K. E. Marsh, E. P. G. Michell, R. H. B. Mills, G. S. Ostlere, P. P. Philip, J. E. Pitts, B. R. Pollard, C. W. A. Pullan, J. S. Rivers, J. T. Rowling, M. Shirley, C. C. D. Shute, I. B. Smith, R. S. Smylie, W. M. B. Strangeways, A. J. Underwood-Whitney, M. W. P. Ward, P. Watson, W. B. Webb, R. H. Whitworth, N. P. L. Wildy, R. H. Wilkinson, I. P. Williams, C. J. Wilson, I. D. P. Wootton.

Women: H. F. Barnes, C. B. P. Bosanquet, M. A. Brown, M. H. Moller, C. M. Plackett, F. M. Saunders, P. M. Townshend, G. B. Wrong.

UNIVERSITY OF LONDON

Prof. R. J. S. McDowall, M.D., and Mr. V. E. Negus, M.S., F.R.C.S., have been appointed Fellows of King's College.

In view of the fact that Sir John Bland-Sutton built and paid for the Institute of Pathology, of which the professor is the director, and that the school has now received a bequest of approximately £600 a year from Lady Bland-Sutton, the title of the University Chair of Pathology tenable at Middlesex Hospital Medical School has been changed to "Bland-Sutton Chair of Pathology."

Lionel Sharples Penrose, M.D., has been appointed to the Galton Chair of Eugenics tenable at University College from the date on which he is able to take up his duties. Claude Rimington, Ph.D., has been appointed to the Chair of Chemical Pathology tenable at University College Hospital Medical School from May 1.

The Western Ophthalmic Hospital, Marylebone Road, N.W., has been added to the list of institutions from which the University receives certificates in respect of part of the experience as clinical clerk or dresser for the purposes of the M.B., B.S. degrees; the South Middlesex Fever and E.M.S. Hospital, Isleworth, has been included in the list of hospitals approved for instruction in infectious diseases and fever hospital administration for the D.P.H.; and the appointment of assistant pathologist at the West London Hospital has been approved for the purposes of the M.D. examination (Branch 11).

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Prof. F. Wood Jones, F.R.S., F.R.C.S., has been appointed the first Sir William H. Collins Professor of Human and Comparative Anatomy in the College, and will take up his duties on retiring from the chair of anatomy at Manchester University at the end of the year.

The College has been gratified to receive a donation to the Restoration Fund from the Director-General, Army Medical Services, and the Regular Officers of the Royal Army Medical Corps. This brings up the total of the fund to nearly £40,000.

At an ordinary meeting of the Council of the College, held on June 14, with Sir Alfred Webb-Johnson, Bt., President, in the chair, the sixteenth Macloghlin Scholarship was awarded to Peter George James Duncan, of Epsom College.

Sir Reginald Watson-Jones was appointed representative on the Court of the University of Liverpool for three years from Jan. 1, 1945. Prof. Ernest Finch was reappointed representative on the Court of Governors of the University of Sheffield for three years from July 1. It was reported that Sir Frank Colyer had been appointed a Hunterian Trustee.

Votes of thanks were accorded Mr. C. A. Boughton Knight for providing storage space at Downton Castle, Ludlow, for 30,000 books during the war years; to the Royal Society of Medicine for storing other parts of the College library in safe premises at St. Albans; and to the Royal Cancer Hospital for giving safe custody for the College plate at Pollards Wood during the war years.

Diplomas of Fellowship were granted to the following successful candidates:

E. J. J. Borges, P. H. Lenton, W. R. Welply, Doreen Nightingale, F. X. Darné, I. J. Thomas, D. G. Lambley, A. H. Harvie, W. Houston.

Diplomas of Membership were granted to Jack Upsdell (Cambridge and Middlesex Hospital), and David Verel (Cambridge and London Hospital).

Diplomas in Anaesthetics were granted jointly with the Royal College of Physicians of London to the following successful candidates:

E. Asquith, W. Atkin, N. W. Bartrop, R. A. Binning, Angela J. Brayn, Diana M. M. Carr, D. J. Carter, J. Clutton-Brock, T. A. Copp, Audrey M. Dealler, W. M. Dinwoodie, Elizabeth H. Flett, A. C. Forrester, Mary Foster, Margot W. Goldschmidt, K. N. A. Herdman, H. C. Hill, J. K. Irving, B. D. L. Johnson, B. Kenton, J. Lorber, W. S. MacGowan, G. D. McGrath, H. P. Price, W. K. Rae, Kathleen M. Rains, D. Reckless, Mary McC. Richmond, Renée Ritchie, A. L. G. Robertson, W. N. Rollason, B. Sullivan, A. Tom, H. Walton, B. H. Wilshere.

The Services

Col. (local Major-Gen.) S. Arnott, C.B.E., D.S.O., late R.A.M.C., has been appointed a D.D.M.S., and has been granted the acting rank of major-general.

The following medical officers have been mentioned in dispatches: Surg. Capt. G. E. D. Ellis, R.N., Surg. Lieut.-Cmdr. F. W. Baskerville, R.N., Surg. Lieut.-Cmdr. R. B. H. Faichney, R.N.V.R., Temp. Acting Surg. Lieut.-Cmdr. F. C. Edington, R.N.V.R., Temp. Surg. Lieuts. G. M. Baird and D. R. Kerr, R.N.V.R., and Surg. Lieut. J. D. B. Baird, R.C.N.V.R.

R.A.F. BIRTHDAY HONOURS

The names of the following medical officers of the R.A.F. appeared in the recently published Birthday Honours List:

O.B.E. (Military Division).—Group Capt. R. H. Stanbridge, R.A.F.; Group Capt. R. G. James, R.A.F.O.; Wing Cmdr. J. B. Wallace, R.A.F.; and Squad. Ldrs. H. O. Hughes, D. N. Matthews, and A. Russell, R.A.F.V.R.

M.B.E. (Military Division).—Fl. Lieut. J. Hood, R.A.F.V.R.

Commended for Brave Conduct.—Fl. Lieut. D. Crichton, R.A.F.V.R.

Mentioned in Dispatches.—Air Cdre. F. J. Murphy, R.A.F.; Group Capts. V. R. Smith, C. G. J. Nicolls, and L. Freeman, R.A.F.; Wing Cmdrs. C. C. Barker, K. B. Redmond, J. L. Roche, and P. A. Wilkinson, R.A.F.O.; Wing Cmdr. W. D. Peock, A.A.F.; Wing Cmdrs. D. G. Smith, L. L. Ingram, J. C. Taylor, D. J. Dawson, and F. V. Maclaine, R.A.F.; Wing Cmdrs. J. A. Lennox and O. Plowright, R.A.F.V.R.; Squad. Ldrs. M. R. Chassels, A. P. Gorrie, G. L. Gryspeerdt, L. D. A. Hussey, W. L. James, T. S. B. Kelly, J. H. McElney, R. E. McKenzie, D. H. G. MacQuaide, E. J. Blair, C. W. D. Cole, N. Vere Hodge, E. H. Jones, J. H. McCoy, I. M. MacGregor, F. L. E. Musgrove, A. J. S. Bell Tawse, and T. H. Cullen, M.B.E., R.A.F.V.R.; Squad. Ldr. J. B. Murphy, R.A.F.O.; Fl. Lieut. K. G. Eckersley, R.A.F.; Fl. Lieuts. A. H. Cutting, C. H. Dhenin, G.M., A. H. Fairlamb, and R. M. Emrys-Roberts.

CASUALTIES IN THE MEDICAL SERVICES

Killed in action.—Capt. John Philip Irwin, R.A.M.C.

Previously reported missing at sea, now presumed killed.—Capt. Jenkin Robert Oswald Thompson, R.A.M.C.

Died in Hong Kong on Sept. 8, 1944, while a prisoner of war.—Surg. Lieut.-Cmdr. William Donald Gunn, R.N.

Died in Germany as the result of an accident.—Surg. Lieut.-Cmdr. James Leo Malone, R.N.

Died from enteric fever in India.—Lieut. Edith Mary Robson, R.A.M.C.

Wounded.—War Subs. Capts. D. H. Brown, A. F. Crick, G. C. Griffiths, E. G. Hardy, and J. Watson, and Temp. Major D. Macrae, M.C., R.A.M.C.

DEATH IN THE SERVICES

Major R. G. Gayer-Anderson, R.A.M.C.(ret.), who held the Egyptian rank of Lewa (major-general) with the title of Pasha, died on June 16 at the Little Hall, a beautiful early fifteenth century house at Lavenham, Suffolk, which, it was announced in 1942, he and his twin brother, Col. T. G. Gayer-Anderson, late R.A., would leave by will to the Surrey County Council as a hostel for young artists and art students. He was born on July 29, 1881, in Northern Ireland, and from Tonbridge School went to Guy's Hospital, qualifying M.R.C.S., L.R.C.P. in 1903. After house appointments at Guy's he joined the R.A.M.C. in 1904, and reached the rank of major in 1914, but was seconded to the Egyptian Army 1907–17. He received decorations for service with the Tagoi Patrol after working with the leprosy inquiry at Kordofan, and on the Sudan sleeping sickness commission and leprosy commission. Grenville Gayer-Anderson withdrew from the practice of medicine and was appointed assistant adjutant-general for recruiting, Egyptian Army, 1914–17. He served at Gallipoli and in Arabia, and became political officer to the Red Sea Patrol. He was wounded and received further decorations from the Khedive, and during the Egyptian revolution, 1919, acted as senior political officer for Upper Egypt. He retired from the Army in 1920 to become senior inspector under the Ministry of the Interior at Cairo, and two years later Oriental Secretary at the Residency. He continued to live in Cairo until 1942, interesting himself in the study of Egyptology and Eastern antiquities. He was appointed subcommissioner (Middle East) by the British Red Cross and Order of St. John War Organization in 1941, and after his return to England lived with his brother at Lavenham. He handed over to the Egyptian nation the Bayt-el-Krediea (a sixteenth century Arab house in Cairo) as a museum of Oriental arts and crafts.

Medical Notes in Parliament

On June 15, before the prorogation and dissolution of Parliament, the Royal Assent was given to the Camps Act, Town and Country Planning (Scotland) Act, Education (Scotland) Act, Family Allowance Act, Water Act, and to other Acts.

Scottish Health Services Reviewed

When closing for the Government the debate on June 12 which was devoted to national health, Cmdr. Galbraith, Joint Under-Secretary for Scotland, surveyed public health in that country. He said that despite the strains of war the health of the Scottish people, as shown by health indices, had in many respects been better than in the immediate pre-war years. Stillbirths since 1939 had been reduced by 9.5 per 1,000 births. The maternal death rate had fallen from 4.9 per 1,000 live births in 1938 to 3 in 1944. In 1938 maternal deaths totalled 432; in 1944, 293. The 1944 rate was half what it was 10 years ago. Infant mortality in Scotland had fallen from 69.5 per 1,000 live births in 1938 to 65 in 1944, the lowest ever recorded, but still far too high. In children between 1 and 5 years the death rate in 1944 was only half what it was immediately before the war and was six and a half times lower than at the beginning of this century.

Notifications of diphtheria dropped from 10,210 in 1938 to 6,805 in 1944. Deaths from diphtheria among children fell from 430 in 1938 to 163 in 1944. Of these 163 deaths only four occurred among children who had been immunized. The Department of Health was satisfied that the campaign for immunization had enormously reduced suffering and deaths among the child population. There was room for further effort. In Scotland tuberculosis was the greatest problem at the moment. Notifications of non-pulmonary tuberculosis remained fairly constant. Notifications of pulmonary tuberculosis increased from 4,793 in 1938 to 7,276 in 1944. Deaths rose from 3,431 in 1938 to 4,174 in 1941. Since then they had declined slightly to 3,935 in 1944. In Scotland more beds had been made available for pulmonary patients, but over 1,700 cases awaited admission to hospital. The shortage of nurses was acute in many hospitals and most serious in sanatoria. The shortage of doctors was another difficulty in that they could not expect any rapid relief, but the civilian health services were being maintained.

Mr. Maxton asked whether steps had been taken to release young men from the Army to take up studies as medical students.

Cmdr. Galbraith replied that medical schools were absolutely full at present and were turning out as many doctors as possible. Demobilization of doctors from the Forces came under the ordinary demobilization scheme.

Mr. Maxton asked whether boys who had never been in the Army were to have a higher claim on the limited accommodation in medical schools than those who were now in the Forces.

Cmdr. Galbraith said every facility was being given to men in the Services to train themselves for their professions. Continuing his survey he said the school health services had shared in staffing difficulties, but the physical education and nutritional state of school-children had not suffered. In 1944 in Glasgow boys of 5 years of age showed an increase, compared with 1930, of 0.93 of an inch in height and of 1.98 lb. in weight. Boys of 13 showed increases in the same period, covering some 14 years, of 1.67 inches and 6.82 lb. Mortality from cancer had increased from 5,657 in 1919 to 8,735 in 1944. It was regrettable that the war had prevented progress along the lines of the Cancer Act, 1939. It was hoped that considerable advance in facilities for earlier diagnosis and treatment would now be available. Success depended on the willingness of all concerned to co-operate. He appealed to hospital authorities, voluntary and municipal, to get together and consider how best they could use their combined resources to the maximum advantage of cancer patients. The officers of the Department of Health would give any help in their power in the preparation of schemes to that end.

Speaking of the E.M.S. hospitals Cmdr. Galbraith said the demand for accommodation for civilian casualties had been light in Scotland and it had been possible to use many beds for other purposes. The emergency hospitals had treated 34,200 patients from the waiting lists of the voluntary hospitals. Under the supplementary medical service some 10,000 workers had been referred for examination or treatment in hospital. Thousands of extra beds in well-equipped hospitals had been provided by the E.M.S. With alterations to adapt them to peace requirements, these beds would go a long way to remedy the shortage. The Department of Health would aim to integrate these new hospitals with the permanent hospital system of the country. The method of doing so would be considered in relation to post-war development of the hospital services generally.

Replying to points raised in the general debate, Cmdr. Galbraith said the number of nurses in all the nursing services in Great Britain was a little under 200,000. The number of vacancies in those services was 32,000, not taking into account additional demands such as those made by the block system of training nurses. Nor did it take account of the development under the new health service. Questions had been asked about the upward trend of tuberculosis, which had increased between 1913 and 1943 by about 21%. This might well be due to cases being brought to notice through examination for national service. More people had been examined by radiography and other means. Fear of tuberculosis affected recruiting for tuberculosis nursing. Hospitals had been asked by the Health Departments and the Ministry of Labour to give nurses an *x*-ray examination and other tests before allowing them to start work in tuberculosis wards.

Wheat Extraction

Replying for the Ministry of Health on June 6, Mr. Hamilton Kerr told Mr. Stokes that the Standing Committee on Medicinal and Nutritional Problems was asked in writing for its advice before the wheat extraction was reduced from 85% to 80%. This matter was considered by the committee on three occasions, the number of members present varying from 14 to 16, which was the total membership of the committee.

International Conventions on Smallpox Vaccination

Mr. Viant inquired on June 7 why it was proposed in the International Sanitary Conventions for Maritime and Aerial Navigation to fix the validity of a certificate of vaccination against smallpox at not more than three years from the date of issue. Mr. Willink answered that the period of three years specified in the form of international certificate of vaccination against smallpox which related, as the form showed, to a vaccination or revaccination found by the certifying doctor on inspection to have given satisfactory results, had been recommended by international bodies of high competence and experience before its inclusion in the Convention of 1944 by the participating Governments.

Mr. Willink also stated that responsibility for the provisions of the International Sanitary Conventions of 1926, 1938, and 1944, and the International Sanitary Conventions for Aerial Navigation, 1933 and 1944, rested upon the Governments, including His Majesty's Government, which concluded them. The Conventions did not compel travellers to be vaccinated or inoculated. A traveller who had not been vaccinated or inoculated might find, however, on entering the territory of a particular country that restrictions were imposed on him under regulations made by the Government of that country. No Government could be expected to disregard the danger involved from the entry of unprotected persons without restrictions. The general object of the Conventions was to avoid unnecessary quarantine restrictions by the agreement of limits to the degree of restriction which might be imposed in given circumstances. They also included provisions designed to help the local health authorities of the countries of entry to determine, in respect of individual travellers, whether any and, if so, what restrictions were necessary. Mr. Willink saw no reason to seek modification in the Conventions.

Lord Douglass told Mr. Viant on June 5 that the International Sanitary Conventions, 1944, did not require ratification and were now in force.

Pneumoconiosis and Silicosis in Wales

Mr. Seaborne Davies, on June 7, asked what information the Minister of National Insurance had about the prevalence of silicosis and pneumoconiosis in the slate quarries in Caernarvonshire, and whether he would make a scheme in respect of the industry under the Workmen's Compensation Acts. Mr. Peat answered that workmen employed underground in slate mines had been covered by a compensation scheme for silicosis since Jan. 1, 1940. There appeared to be no evidence of the occurrence of disease in the open quarry workings, but recently evidence had been obtained of the occurrence of pneumoconiosis, including silicosis, among men employed in the splitting and dressing sheds. Mr. Hore-Belisha was prepared to consider an appropriate extension of the scheme to men employed in these processes.

On the same date Mr. James Griffiths asked the number of applications received during the past twelve months from among slate quarrymen and miners of North Wales for certification by the Silicosis Medical Board, and what number were granted certificates. Mr. Peat replied that the number of such applications dealt with by the Silicosis Medical Board during the twelve months ended May 30, 1945, was forty-three, and thirty-seven certificates were granted.

R.A.F. Medical Demobilization

On June 8 Mr. Bowles requested an assurance that doctors, medical orderlies, and other medical staffs would not be retained in the R.A.F. after their release group had been reached. Mr. Harold MacMillan replied that in these categories it had only been necessary to restrict the release of nursing orderlies in the group lists so far promulgated. Release would be generally in groups determined by age and length of service, but to maintain the force for the war against Japan it would be necessary to deal separately with the different categories.

U.K. Casualties

Mr. Churchill stated on June 12 that the fatal casualties suffered in Europe by the armed Forces of the United Kingdom between Aug. 1, 1943, and April 30, 1945, were: Royal Navy, 14,036; Army, 56,552; Royal Air Force, 20,336. Of the total casualties suffered by the Royal Air Force, 13,148 were air-crew officers and other ranks of Bomber Command.

Ratio of Doctors to Army Personnel

Sir James Grigg, in reply on June 12 to Mr. Seaborne Davies, said the ratio of medical officers of the R.A.M.C. to Army personnel, male and female, in S.H.A.E.F. and 21 Army Group was about 1 to 382. The responsibilities of the R.A.M.C. included, however, considerable assistance to the other Services and to Allied Forces and to displaced persons. The degree of assistance given by the R.A.M.C. in connexion with these extraneous commitments, and the volume of the latter, fluctuate so greatly, that any exact ratio of doctors to patients or potential patients of all categories was impossible to assess. There were something of the order of 1,400 people of various categories who had to rely on each member of the R.A.M.C. for health services. In theatres of war where active operations were going on the supply of doctors was too low. It might be that there was a feeling in the R.A.M.C. that the proportion was too high and that many of them might be released to help their hard-pressed colleagues at home. It would not be certain that that feeling was not connected with a desire to get home. The average over the United Kingdom was much less than 1 doctor to 4,000 of the population.

Blood Transfusion Service

Major Kimball inquired on June 14 about the future of the blood transfusion services organized during the war in connexion with the Emergency Hospital Scheme.

Mr. Willink replied that, although demands had fallen with the end of the German war, the Emergency Blood Transfusion Service must be kept in being for some time to meet the needs of the Service and civilian patients for whom it was being used. When the emergency was over it was intended to provide a blood transfusion service on a permanent basis. Changes in organization consequent upon the transition from war to peace were now being considered in detail.

Infant Death Rates

The following infant mortality rates per 1,000 live births were recorded in the largest towns of England and Wales in 1943: London 51, Birmingham 55, Liverpool 81, Manchester 61, Sheffield 56.

Corresponding rates provisionally reported in respect of towns in Scotland, Northern Ireland, British Dominions, and America were as follows: Edinburgh 54, Glasgow 82, Belfast 111, New York 30, Chicago 29, New Orleans 39, Baltimore 44.

Training of Midwives

On June 14 Mr. Willink rejected a suggestion from Mr. W. J. Brown that in view of the shortage of maternity nurses he should consider reverting to the earlier practice, as an emergency measure, of regarding six months' maternity training for trained nurses and one year for untrained nurses as adequate for the time being. Mr. Willink added that one of the main objects in lengthening the course of training for midwives in 1938 was to raise the standard of midwifery, following the imposition on local supervising authorities of the duty of establishing a service of domiciliary midwives. The lengthening of the training course had been reflected in an improved midwifery service. Reduction in the period at the present time would be retrograde. He did not, therefore, feel able to invite the Central Midwives Board to consider a revision of their training rules in the way suggested.

Tuberculosis in Returned P.O.W.s.—Three-quarters of the British prisoners who have returned have been examined by mass miniature radiography and the rest will be examined when they return from leave. So far 294 have been found to be suffering from tuberculosis: this is about 3 in every 1,000; 158 have been admitted to civil sanatoria and 136 are in military and E.M.S. hospitals awaiting admission.

Wheat Germ in Flour.—Sir E. Graham-Little suggested on June 14 that Col. Llewellin, to save shipping space and to provide protein, protective substances, and minerals contained in the wheat germ, should during the present stringency increase in the highest measure the proportion of wheat germ required to be included in the national bread. Col. Llewellin answered that the definition of national flour already provided for the inclusion of the maximum quantity of wheat germ which, having regard to the type of milling plant, could be included in national flour at the present rate of extraction in the United Kingdom. Careful examination of samples from all mills indicated that these instructions were being observed.

Vaccination Deaths.—Asked on June 14 what were the ages of the persons certified as dying in 1944 from vaccination or any other symptom connected with vaccination, Mr. Willink reported that the sexes and ages of the persons referred to were as follows:

Assigned Causes of Death	Ages of Males	Ages of Females
Vaccination	—	4 months 4 „
Vaccinia	6 weeks	13 „
Post-vaccinal encephalitis ..	31 years 31 „	3 „ 22 years
Generalized vaccinia	4 weeks	5 months
Encephalitis myelitis	3 months	—

The death of one female child aged 21 months was assigned to septicaemia, vaccination being mentioned on the certificate.

Notes in Brief

Returns from local authorities in England and Wales show 35 deaths from diphtheria during 1944 among immunized children under 15 years of age, compared with 700 deaths from diphtheria among non-immunized children. No information is available on deaths among persons over 15 years of age.

In 1943 and 1944 a total of 7,621 other ranks were discharged from the Army suffering from tuberculosis and 42,480 suffering from psychiatric disorders. It has not yet been possible to extract from the records the figures for earlier years or for officers.

EPIDEMIOLOGICAL NOTES

Discussion of Table

In *England and Wales* during the week notifications of measles fell by 1,992, those of dysentery by 32, and those of diphtheria by 13, while an increase of 176 was recorded for scarlet fever, and of 51 for whooping-cough.

There were no large local fluctuations in the trend of scarlet fever, and most areas showed a slight rise. Warwickshire and Yorks West Riding each reported 28 more cases of whooping-cough than last week, and Lancashire 37 fewer. Yorks West Riding also showed a rise of 20 for diphtheria. Measles, especially in the counties surrounding London, was on the decline; but Kent recorded a rise of 111.

Two large outbreaks of dysentery were reported during the week: Buckinghamshire, Chepping Wycombe M.B. 59 cases, and Hertfordshire, Bishop Stortford U.D. 39 cases. The other large returns were those of Lancashire 67, London 48, Glamorganshire 25, Middlesex 22, Northumberland 21, Yorks West Riding 16, Surrey 15, Kent 14, Berkshire 13, Staffordshire 12, Warwickshire 11, Lincolnshire 11.

In *Scotland* the incidence of infectious diseases fell, measles notifications being 85 fewer than last week; whooping-cough 41, dysentery 36, and scarlet fever 29. The largest returns for dysentery were from the cities of Glasgow 44, Edinburgh 31, and Aberdeen 18.

In *Eire* diphtheria notifications fell by 30, and measles by 24. In Wexford, New Ross U.D., the cases rose from 7 to 16.

In *Northern Ireland* diphtheria notifications fell by 8 cases, but measles rose by 11.

Plague in Europe

Bubonic plague has appeared in Ajaccio, Corsica; it is thought to be related to that of the outbreak of last December in North Africa.

Week Ending June 16

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 1,314, whooping-cough 1,130, diphtheria 438, measles 7,890, acute pneumonia 389, cerebrospinal fever 47, dysentery 464, paratyphoid fever 1, typhoid 5. One case of typhus was imported.

No. 23

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended June 9.

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for: (a) England and Wales (London included). (b) London (administrative county). (c) Scotland. (d) Eire. (e) Northern Ireland.

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for: (a) The 126 great towns in England and Wales (including London). (b) London (administrative county). (c) The 16 principal towns in Scotland. (d) The 13 principal towns in Eire. (e) The 10 principal towns in Northern Ireland.

A dash — denotes no cases; a blank space denotes disease not notifiable or no return available.

Disease	1945					1944 (Corresponding Week)

---

* Measles and whooping-cough are not notifiable in Scotland, and the returns are therefore an approximation only.

† Includes primary form for England and Wales, London (administrative county), and Northern Ireland.

‡ Includes puerperal fever for England and Wales and Eire.

§ Owing to movements of population, birth and death rates for Northern Ireland are still not available.

Medical News

There will shortly be published an advertisement for a Scottish Secretary of the British Medical Association to succeed Dr. Robert Craig, who has reached the age of retirement. A considerable period will be allowed for the sending in of applications so as to enable practitioners serving in the Forces, wherever they may be, to apply.

A meeting of the Middlesex County Medical Society will be held at the Royal Society of Medicine (1, Wimpole Street, W.) on Wednesday, July 4, at 5 p.m., when Sir Reginald Watson-Jones will speak on "Accident Services in the R.A.F."

The National Baby Welfare Council (29, Gordon Square, W.C.1) announces that in view of the General Election taking place during the first week in July, National Baby Week will be celebrated this year from July 15 to 21.

Dr. J. Johnstone Jervis, medical officer of health for the city of Leeds and professor of public health in Leeds University, has been elected president of the Society of Medical Officers of Health for the session 1945–6.

Twelve countries have been invited by the Persian Government to take part in an International Medical Congress, to be held in Teheran during the first nine days of July. They are Great Britain, Russia, the United States, France, Egypt, Syria, the Lebanon, Palestine, India, Turkey, Afghanistan, and China.

The fourth group of distinguished Belgians to visit this country as representatives of the Belgian Fondation Universitaire and guests of the British Council have arrived in London. They are: Profs. M. Florkin, Faculty of Science and Medicine, Liège; F. Albert, Faculty of Medicine, University of Liège; F. Bremer, Faculty of Medicine, University of Brussels; A. Castille, Faculty of Medicine, Louvain; J. C. Firket, Faculty of Medicine, Liège; and H. R. Fredericq, Faculty of Medicine, Liège; M. Jean Willems, hon. secretary, University of Brussels; and Prof. L. M. Gyselynck, Faculty of Law, Brussels. They will meet leading British authorities in their particular spheres in universities and research institutions in London, Cambridge, Oxford, Liverpool, Edinburgh, Glasgow, and Belfast.

The British Council has arranged a medical course for members of the U.S. and Dominion Forces on leave, to be held at the University Overseas Club, Birmingham, from July 9 to 14. The programme includes addresses by Dr. H. P. Newsholme, M.O.H., Birmingham, on "Public Health Administration"; by Prof. H. P. Gilding, on "Plasma Proteins"; by Dr. H. Guy Dain on "The State and Medicine"; by Lieut.-Col. A. Torrie, on "The Health of the Mind"; by Prof. A. C. Frazer on "Recent Advances in Fat Absorption"; by Dr. J. F. Brailsford on "Radiology of the Chest"; by Prof. K. D. Wilkinson on "Infectious Hepatitis"; and by Dr. Brian Taylor on "Intrathoracic New Growths." There will also be visits to the Queen Elizabeth Hospital, to the Medical School of the University, to Barnsley Hall Emergency Hospital at Bromsgrove, and to the Dudley Road Hospital, Birmingham.

The Howard League for Penal Reform hopes electors will bring to the notice of candidates for election to Parliament its recent resolution calling for a comprehensive measure of penal reform which is urgently needed in view of the abandonment of the Criminal Justice Bill of 1938. The resolution also calls for unity of all parties in demanding a Bill which will provide, among other things, for: observation centres, improved remand homes, and other facilities for full medical and psychological examination of offenders before sentence: hostels for adolescents on probation and otherwise; control of residential schools by Ministry of Education, not the Home Office; possession of diploma in psychological medicine by every prison medical officer; non-penal colonies for habitual criminals; and abolition of imprisonment for all persons under 21, of corporal punishment, and of the death penalty.

The Minister of Health sent on June 13 a message to every voluntary hospital which has taken part in the Emergency Hospital Scheme expressing warm thanks to the governing body, the medical, nursing, radiographic, and other technical staff, and the administrative, clerical, domestic, and other staffs, as well as all the voluntary workers who have co-operated with them, for their splendid work during the last six years. "Often under air attack, and always under the handicap of staff shortages and other wartime difficulties, the voluntary hospitals have given the Government magnificent assistance in the treatment and care of Service casualties and sick, air-raid casualties, and all the other classes of patients for whom I am responsible under the Emergency Hospital Scheme. This has been patriotic service of the highest order. We still have to finish the war with Japan, and it will be necessary to ask many of the voluntary hospitals to keep on giving their help, although perhaps on a reduced scale. I know that for as long as the need exists the Government can rely upon your co-operation."

Letters, Notes, and Answers

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE. LONDON, W.C.1. TELEPHONE: EUSTON 2111. TELEGRAMS: *Aitiology Westcent, London.* ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors over-seas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Manager, B.M.A. House, Tavistock Square, London, W.C.1 (hours 9 a.m. to 5 p.m.). TELEPHONE: EUSTON 2111. TELEGRAMS: *Articulate Westcent, London.*

MEMBERS' SUBSCRIPTIONS should be sent to the SECRETARY of the Association. TELEPHONE: EUSTON 2111. TELEGRAMS: *Medisecra Westcent, London.*

B.M.A. SCOTTISH OFFICE: 7, Drumsheugh Gardens, Edinburgh.

ANY QUESTIONS?

D.D.T. for Bees, Wasps, and Hornets

Q.—*Has any work been published on the effect of D.D.T. on bees, wasps, and hornets?*

A.—There are several short notes on the toxicity of D.D.T. to bees in the *Journal of Economic Entomology* of 1944 (**37**, 159, 537, and 849). The chemical is quite toxic to bees, both as a stomach poison and by contact. The last of the accounts mentioned describes a way of exterminating colonies of bees in unwanted places by blowing in D.D.T. powder with a dust gun. (About 5 oz. of 20% dust was used.) This method might be employed for nests of wasps and hornets; though there appears to be no actual published information on the use of D.D.T. for these insects.

Types of Syringe Needle

Q.—*How many different types of syringe needle are in common use—e.g., Record, Luer, etc.? How does the gauging of these needles differ? The gauge is apparently expressed in terms of the external diameter of the needle; what is the relation between the external diameter and the lumen of the needle, and is the ratio the same with all sizes of needle? How does the method of manufacture ensure a smooth inner surface to the needle to prevent accumulation of debris?*

A.—There are three standard sizes of needle mounts which are in common use—namely, the Record, Luer, and S.I.M.A. With regard to needles some houses have their own series. The standard sizes are as under:

Hypo Range	Diam. B.W.G.	Diam. mm.	Length mm.
20	26	0.45	15.5
19	26	0.45	17.5
18	26	0.45	19
17	25	0.50	23.5
16	24	0.55	25
15	23	0.60	25
14	23	0.60	30
12	23	0.65	30
2	22	0.70	33
1	21	0.80	38

The above is the standard series of hypodermic needle sizes. In addition, exploring and aspirating needles are made from 1½ in. to 4 in. long in sizes from 14 to 20 standard wire gauge. The lumen of the needles varies in accordance with the external diameter, as the larger needles have a thicker wall. The method of manufacture ensures the internal bore being smooth, as needles are made by being drawn down from a short length of large-diameter tubing to fine sizes for hypodermic needles. When ordering, either the standard or Birmingham wire gauge should be used; this varies slightly, but the difference on fine sizes is infinitesimal.

The question of sizes of hypodermic needles and mounts has been considered by the Surgical Instrument Manufacturers Association and a standard series has been arranged. This standard has been approved by the British Standards Institution, and will be manufactured as soon as circumstances permit. Although the various series will continue to be made, it is hoped that eventually all mounts and needles will be of a standard size.

One Under-developed Breast

Q.—*A nullipara aged 23 has a right breast only half the size of the left, which is about normal. It is surrounded by a retracted nipple on which manipulation has had no effect, and small doses of stilboestrol have not altered the contour. I would appreciate advice.*

A.—The cause of this condition is not a hormone deficiency or imbalance (as is evidenced by the normal development of the left breast) but an inherent defect in the right breast, the tissues of which are incapable of response to the normal hormone stimulus. It is therefore not surprising that there has not been any response to stilboestrol, nor is there likely to be even if the dose is increased. Daily applications of an oestrogen ointment to the hypoplastic breast might be tried, but if they have any effect it is more likely to be due to the massage than to the ointment. Indeed physiotherapy—contrast bathing and regular massage—probably offers the only hope of improving matters. But it is a forlorn hope, and it is doubtful whether any treatment will produce even temporary, let alone permanent, enlargement of the affected breast.

Seborrhoea Capitis

Q.—*I am treating without success a persistent case of seborrhoea capitis in a man. The scalp is slightly irritated and red, possibly owing to the use of medicaments. Advice would be appreciated.*

A.—Seborrhoeic dermatitis has been prevalent and common during this war as in the last. In its treatment, especially when the scalp, face, or neck is affected, it is important to take into consideration the liability to eczematize. When in doubt it is a good rule to apply oily calamine with or without the addition of ichthammol, 1 or 2%. A messy application of this kind calls for a weekly shampoo, which should be followed by a fresh application of the oily lotion. When the inflammation has subsided sulphur in very weak concentration (less than 1%) in zinc cream can be tried. Inflamed seborrhoea capitis can be easily overtreated.

Sonne Dysentery Carriers

Q.—*A family of three children, aged 3, 8, and 14 years, has positive rectal swabs at the same time. The diarrhoea has ceased; stools appear normal, and they are quite well, but each has a positive swab between one or two negative ones. Is there any treatment that will clear up the infection and is there any reason why the two elder ones should be kept away from their day school, and for how long? The parents are worried at their absence from school.*

A.—Although it is not so stated, it may be presumed that these children were suffering from Sonne dysentery and are now convalescent carriers of the Sonne bacillus. The convalescent Sonne carrier is particularly difficult to cure by specific measures, but most cases clear up spontaneously in 3 to 4 weeks' time. For the more persistent carrier the safest and perhaps the most effective sulphonamide to use is succinylsulphathiazole, which in children aged 3 to 14 years should be given in 1½-gramme doses four times a day for 5 to 7 days. If it is not available, sulphapyridine, in rather smaller dosage may be tried. Whether these convalescent carriers are likely to be a source of danger to their school-fellows is a difficult question to answer. If they are taught the simple rules of good hygiene—to wash the hands after using the w.c. and before handling food—the risk of their spreading infection is minimal. As they are day-boys, there seems little justification for keeping them from school provided they are not allowed to act as food-servers during the midday meal. Sonne dysentery is often so mild that many cases are not diagnosed, and it is the *missed* case or carrier who is most likely to spread the infection.

Tenacious Plugs in Lungs in Asthma

Q.—*Is there any drug for removing the tenacious mucous plugs which form in the lungs in asthma? What quantity should be used and how often, and how long should each course of treatment last?*

A.—Tenacious mucous plugs which form in asthma are exceedingly troublesome and distressing. Probably the best method of dealing with them is to put the patient to bed and to give him an injection of adrenaline which will open the bronchioles widely. When the airway is thus made clear the natural ciliary action will remove the mucus by driving it upwards. So far as other drugs are concerned there is a prescription intended for this purpose in the *National War Formulary*, containing 3 gr. potassium iodide, 2 min. ext. stramon. liq., in 1/2 oz. chloroform water. This can be taken three times a day, or more often if necessary. The stramonium contains hyoscyamine and hyoscine, which dilate the bronchioles, while the potassium iodide loosens the tight plugs of mucus by causing a more watery secretion.

Herpes Labialis

Q.—*Have there been any recent advances in the treatment or prophylaxis of herpes labialis, or any new factors found in its aetiology? A woman patient, who can remember recurrences of a "cold on the lip" since her early childhood, has had 9 recurrences during the past year at intervals of a few weeks; and the more recent eruptions have left pigmented scars. No precipitating factor has been isolated. The patient is otherwise in good health.*

A.—Herpes labialis remains an intractable condition. Attempts have been made to treat it with vaccines of the causative virus or a related virus, but one would expect little success from such measures on *a priori* grounds. *X*-irradiation of the affected areas has also been recommended, but there does not appear to be any record of controlled tests of either vaccine or radiation therapy. At the moment, the only treatment one can recommend is measures to improve the physical and mental state of health.

Post-menopausal Pregnancies

Q.—*In some books of birth control it states that it is advisable to use anticonception methods for up to two years after menstruation has ceased. What is the explanation of this?*

A.—Some considerable time must inevitably elapse before a woman can be reasonably certain that she has had her last menstrual period, but, leaving aside such considerations, the explanation really depends on the fact that ovulation can occur without menstruation, and vice versa. The menopause does not necessarily imply cessation of ovarian function, and very often the climacteric occurs several years after the menopause. There is abundant evidence—such as the finding of signs of follicular activity and corpus luteum formation at operation—to show that ovulation sometimes occurs, although not necessarily regularly, after the menopause. Moreover, cases of pregnancy occurring several years after the last menses are on record, and reference was made to some of these in a reply published in the *Journal* of Dec. 11, 1943 (p. 771). However, the chances of a post-menopausal pregnancy are not high, and after 2 years' amenorrhoea they are extremely remote.

Diabetic Gangrene

Q.—*What is the modern treatment of diabetic gangrene of an extremity? I would particularly value advice regarding (a) application of heat or cold to the limb, and (b) amputation. Most textbooks advise that the limb should be wrapped in cotton-wool and kept warm; many teachers advise that the limb be kept ice-cold and the body warm. Which is physiologically correct? Again, regarding amputation, many advise the avoidance of amputation almost at all costs; others advise early amputation if the condition of the arteries permits.*

A.—Diabetic gangrene is usually a moist, septic spreading gangrene tending to cause death in coma. A line of demarcation rarely forms, so that in the established condition the only hope of relief lies in amputation. This should be done at a level at which the blood supply is adequate for healing and where the tissues are not grossly infected, after a preliminary period of treatment directed to carbohydrate, insulin, and fluid requirements. Conservative treatment should be reserved for those in whom, by reason of poor general condition, the risks of an operation are thought to be prohibitive. Many of this class, however, can be made relatively safe for amputation by first regulating their metabolism and occasionally by incision and drainage of superficial abscesses. A good deal of the operative mortality in the past has been due to sepsis in one way or another, and it is likely that in the future the prospects will be improved by the use of penicillin, so that more patients can be offered the benefits of surgery. Avoidance of amputation "at all costs" is an extreme view which will cost many lives.

In deciding on the level of amputation the primary consideration is the ability of the tissues at a given level to heal, having regard to the local circulation; the suitability of the stump for an artificial limb is of comparatively small importance. Arteriosclerosis is practically always present and is a hazard which must be faced; it has a decisive bearing on the amputation level. Where gangrene is limited to a toe or toes, local amputation is sufficient provided there is a good circulation in the foot. Where gangrene or deep infection has extended above the toes, a thigh amputation is best. An upper-leg amputation is permissible if the popliteal artery pulsates and if the leg is uninfected, but generally this is an unsafe amputation for arteriosclerotic patients. Any amputation below the knee may later need re-amputation through the thigh.

Local application of heat is the worst kind of treatment. It increases tissue metabolism, creating an increased demand for oxygen which cannot be met by the depleted blood supply; and it also encourages bacterial growth. The effect is spread of gangrene and of infection. Application of cold has the opposite effect and is obviously sound therapy; it also tends to diminish pain. It is sufficient to keep the limb exposed at room temperature. Actual refrigeration has been used as a preliminary to amputation. By effecting a "physiological amputation" it produces a great improvement in the general condition, so that this form of treatment probably has a considerable future. The rest of the body should be kept warm but not overheated. Reflex vasodilatation of the affected limb is a rational procedure, but its value is limited by the poor capacity of sclerosed vessels to dilate. Following amputation, however, it might make just the difference between success and failure.

Dystrophia Adiposo-genitalis

Q.—*What is the modern treatment for dystrophia adiposo-genitalis?*

A.—In this condition, which is also termed Froehlich's syndrome, adiposity and failure of sex development are the outstanding features; occasional dwarfism is a complication. Sex development can be produced by injections of gonadotrophic hormone (500 units per c.cm.) 1 c.cm. twice weekly for six weeks, the course repeated after an interval of some weeks. The treatment of the adiposity is that of adiposity in general—namely, diet and thyroid—and the response is only partial. The treatment of the dwarfism is by thyroid and growth hormone.

Relief of Tinnitus

Q.—*A woman aged 50 has suffered from "noises in the head" since a post-scarlatinal infection of the ear in childhood. These have become gradually more severe and distressing. Is there any means of relieving the symptoms?*

A.—A course of short-wave diathermy to the affected ear will occasionally relieve the tinnitus, and is worth a trial. If the tinnitus is high-pitched, the administration of nicotinic acid may help. Failing relief, the usual sedatives, acid. hydrobrom. dil. or phenobarbitone, should be given.

Fly Repellents

Q.—*What is the best fly repellent (with special reference to the article in the* Journal *of May 19 entitled "Dimethyl Phthalate as an Insect Repellent," in which indalone is mentioned)? What is indalone? What is its smell and consistency, what is its cost, and where can it be obtained? Is it the sort of thing which an old lady would be grateful to have sprayed on her pillow, or would she prefer to let the flies go on crawling over her nose?*

A.—It should be realized that most effective repellents act by contact rather than by the smell of the vapour. Their principal use, therefore, is against biting insects, either by treating the skin or else clothing over which the insect may travel on its way to bite. There does not seem to be much data on repellents for houseflies, though some American experiments in 1939 showed that indalone was much more effective than citronella in preventing flies from settling on a molasses bait. Indalone, which is αα-dimethyl α-carbo-butoxy dihydro-γ-pyrone, is an amber-coloured liquid with little or no smell. Like dimethyl phthalate it can be applied to the skin without danger. It is manufactured in the U.S.A. and cannot be freely purchased in this country at present.

Probable Case of Neurosyphilis

Q.—*Three or four years ago a woman consulted me for pains on the left side of her face. The pupil of her left eye was dilated and reacted to light but not accommodation. A Wassermann test was positive. Since then I have given her regular courses of injections of bismuth and arsenic preparations. Three subsequent Wassermann tests have still proved positive. Shall I continue with the treatment already given or can you recommend any other better remedies to be used by intramuscular injection, as this is much easier for a general practitioner than intravenous injection?*

A.—This question would be easier to answer if more particulars were available—e.g., previous history, family history, age of the patient, whether married or single, any miscarriages, state of other reflexes, etc. A dilated left pupil which reacts to light but not to accommodation is the exact opposite of the Argyll-Robertson pupil, but in view of the fact that the Wassermann reaction has been repeatedly positive it seems probable that the patient is suffering from neurosyphilis in some form. For this reason it is essential that an examination be made of the cerebrospinal fluid together with a complete clinical examination of the nervous and vascular systems; the former is beyond the scope of the average general practitioner and the patient should be referred to an expert syphilologist. Treatment will depend on the results of examination and particularly on the state of the cerebrospinal fluid. If the fluid is normal or shows only mild changes, potassium iodide by mouth and bismuth intramuscularly will probably prevent extension of any morbid process; if, on the other hand, the fluid shows marked changes, including a strongly positive Wassermann reaction and a paretic type of gold curve, more drastic methods are indicated, such as artificial fever (malaria) therapy followed by repeated courses of tryparsamide intravenously and bismuth intramuscularly. In this connexion it cannot be too strongly stressed that it is the patient who should be treated, not the positive serum reaction; the type and amount of treatment will depend mainly on the clinical signs and the effect of treatment on the reactions of the cerebrospinal fluid.

INCOME TAX

Child Allowance

R.M.'s child was born on April 3, 1944. Which is the first year for which he is entitled to the £50 allowance?

*** The full £50 is due for the year ending April 5, 1944.

Hospital Appointment

J. D. inquires as to the deduction of certain expenses.

*** (1) Cost of moving to take up appointment—not allowable. Such expenses are incurred anterior to, and not in the carrying out of, the duties of the appointment. (2) Expenses to be incurred in acquiring the D.P.M.—not allowable. Such expenses are of a capital nature and therefore not allowable against income.

LETTERS, NOTES, ETC.

National First-aid Service

Dr. Bowman Edgar (Kirkconnel, Dumfriesshire) writes: First aid has, along with medicine and surgery, made striking advances during the last five years. The experience gained in war and under attack from the air has proved how useful can be a system of well-organized rescue work. It is to be hoped that first aid will not be allowed in peacetime to drop back for lack of broad outlook and organizing keenness to the rut it has occupied for too many years. Is it not to be deplored that no fewer than three "Societies" (St. John's in England, St. Andrew's in Scotland, and the B.R.C.S.) appear necessary to carry on first aid in this small island? These societies are, without a doubt, doing excellent work each in its own sphere, but not one of them can speak for the British first-aid workers as a whole; not one of them is capable *per se* of organizing, or is entitled to co-ordinate, the work on a national basis, and so far no hint of a move in that direction has been heard from any of the three. The following true case is worth consideration. Some years ago a Government order was issued to certain works instructing that, for every so-many workmen employed, there must be one man holding a first-aid certificate. By going over the works with a small-tooth comb and accepting certificates dated up to *25 years* previously, the management was able to obtain the requisite "first-aid men" (alleged!). The letter of the law was thus obeyed. The spirit of the law and the interests of any injured man were apparently of no importance whatever. The works sent in their full quota of names; they did not state that 75% were quite inefficient. And there was no F.A.H.Q. with authority to intervene in the interests of the injured. The law had been obeyed; what happened to any casualties just didn't matter. This blind acceptance of certificates as evidence of training and ability to perform work efficiently brings us to one big question which must be squarely faced, and answered. Is first aid to achieve promotion in these coming post-war years to its rightful high place on the list of national services? Under all manner of enemy attack the British first-aider has proved, over and over again, his personal courage and the immense value of the training he has received. Does he not deserve to be raised to membership of a properly organized national service, with recognition and privileges as such? This reward to the "first-aiders of the 'blitzes'" could be achieved by establishing a representative "British Council of First Aid" with the following mandate: (1) The "continuation, intensification, and modernization" of first-aid training in Great Britain. (2) The standardization of this training over the whole country and the raising of examination standards. (3) Revision of the system of certification, the award of badges in place of certificates, and the establishment of these badges under the "unauthorized wearing" law. (4) Co-operation with Government Departments and the "High Command" in any questions touching first aid (as in the case mentioned above). (5) Recruiting of the best type of volunteer. (6) Consideration of conditions of service of full-time first-aid personnel. (7) The establishment, at the earliest possible date, of the "Royal First-aid Service of Great Britain." (8) The publication of an official up-to-date "Manual of British First Aid", with space at the end for quarterly "bulletins" of up-to-the-minute information. This is merely a preliminary survey of some of the steps required to set the service on a national basis, which is its just due.

Calciferol and Toxisterol

Mr. J. Greenbaum, B.Sc., Ph.D., writes: In the *Journal* of May 19 (p. 721) a correspondent asked a question concerning the existence and toxicity of toxisterol. The answer given was in error when outlining the sequence of ergosterol irradiation products, and particularly in stating that calciferol is the first irradiation product of ergosterol, which is then further irradiated to lumisterol, tachysterol, and toxisterol. The correct sequence of substances on irradiation is as follows: ergosterol, lumisterol, protachysterol, tachysterol, calciferol, toxisterol, and suprasterols. As will be seen from this, calciferol is an end-product of a series of substances, and is transformed into toxisterol, so far as is known, without intermediate compound formation, on further irradiation.

Corrections

Air-Cdre. T. C. St. C. Morton wishes to correct a typing error in his article on "Diodoquin for Chronic Amoebic Dysentery" published on June 16. The fourth line under "Conclusions" on page 832 should read "approximately one-fourth of the cases have relapsed," not one-third.

By a misprint in the obituary notice of Mr. Bishop Harman published last week the late Dr. Wallace Henry's name was printed as Henry Wallace.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY JANUARY 6 1945

HEALTH CENTRES AND THE NATURE OF GENERAL PRACTICE

BY
A. GARVIE, M.D.

The main purpose of this paper is to show that the segregation of doctors in Health Centres would diminish their opportunity to study aetiology. The clinical evidence is based on data selected from an epidemic of influenza and has been limited to the period chosen for the health survey field workers of the Ministry of Health in their review—namely, from Oct. 1 to Dec. 31, 1943.

From the respiratory complaints which occurred during this period two groups were extracted. These groups had a common characteristic in that the interval from the onset of the illness to the first consultation had been brief. In one group, however, the patient spoke of pain in his preliminary description, whereas in the other all suggestion of pain was absent. The term "cold" is usually applied by the patient to the latter. It causes minor discomfort and little incapacity. On the other hand, "influenza" is usually applied to the former and in general leads to incapacity for work. Many objections could be advanced against the terms "cold" and "influenza," but for clarity the terms are used throughout this paper in the above sense and are not based on the presence or absence of any specific type of organism.

The selection and subsequent analysis were effected by mechanical methods, otherwise too much work would have been involved. The methods are easy to handle, but it is impossible to give any brief and, at the same time, lucid description of them. I would therefore ask that, for the present, it will be accepted that the data in this paper have a high degree of accuracy and are totally free from any personal bias on my part.

It had been my impression that the distance a patient had to come to the surgery was an important factor in determining whether he came at all when he believed that his illness was unimportant. To test this scientifically I grouped my panel patients into four zones A, B, C, and D, where in A the patient would take less than 5 minutes to walk to the surgery, in B from 5 to 10 minutes, in C from 10 to 15 minutes, and in D more than 15 minutes. The patients in all four zones were industrial workers. They intermingled in factories and workshops, and so it was assumed that the incidence of influenza had been the same in all districts. The proportion, therefore, of influenza among my panel patients should have been the same in each zone, provided that the distance which the patient resided from the surgery did not affect his decision to seek medical attention. This was found to be true, the percentages being 4.2, 3.6, 3.1, and 4.5. The variation in these percentages has no significance, being within the probabilities of that chance difference of percentages between different groups of people exposed to the same risks. For colds there ought also to have been equality among the zones for the same reasons, but in fact the percentages showed progressive diminution from A to D, the figures being 6.5, 4.9, 2.85, and 1.75. These figures cannot be accepted as arising from any chance distribution. (The difference in percentage between the first and the third zones is 3.65, the standard error being 1.45, and between the first and the fourth 4.75, the standard error being 1.54.)

The result of this analysis leads one to conclude that where the patient believes he has influenza he will be seen by his doctor irrespective of distance, but where the patient thinks he has a cold, unless the surgery is very convenient, he will not ask for medical attention even when it is offered free of charge. It is evident, therefore, that some correction must be made in the *apparent* incidence of colds during an epidemic before it can be compared with the incidence of influenza. It was while engaged on this work that I realized that the segregation of doctors in clinical Health Centres would reduce the number of patients they had been in the habit of seeing and restrict the opportunities of any of them who wished to make a clinical study of aetiology.

A series of histograms has been prepared. They have been constructed on an assumption that, instead of the historic method of doctors "putting up their plates" in different areas of a growing town, the original practice of the small township had been able to retain a monopoly of the area. As the town had spread outwards and filled one zone after another, the increasing demand for doctors had been met by the original surgery becoming a clinical Health Centre, in which the number of doctors was increased according to the needs of a growing population. The 1943 epidemic occurred during this expansion. The varying pictures of that epidemic as it would have been seen by the doctors, according to the degree of dispersion of their practices at the particular time, are illustrated in the series of histograms. I have avoided going into the full mathematical details of how such histograms can be constructed, but the following account is given.

It was assumed that the average person in a town walked at about two and

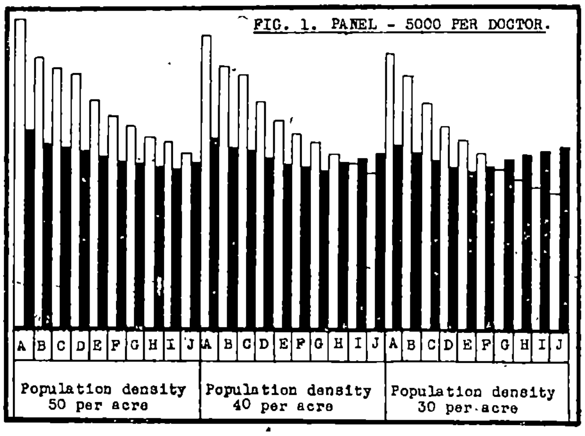

FIG. 1. PANEL - 5000 PER DOCTOR.

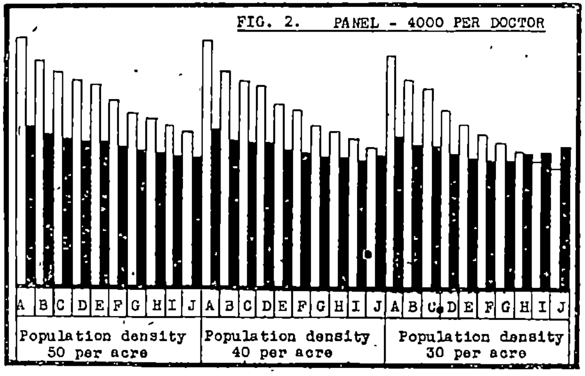

FIG. 2. PANEL - 4000 PER DOCTOR

Common colds = White columns.
Influenzas = Black columns.

A denotes data of a single isolated doctor, B the data of one of 2, C the data of one of 3 . . . J the data of one of 10 in a common consulting centre.

a half miles per hour, and so any person in approximately a hundred acres would be within five minutes' walk of the surgery, the surgery being situated at the centre of the zone. The possible number residing in this area constitutes the insured population of the first zone. Density of population is a widely varying quantity. Many authorities advocate a maximum of twelve houses per acre, and, as the average number of persons per house is 3.75, three population densities were analysed—namely, 50, 40, and 30 per acre. The density for any large area is, of course, affected by open spaces, factories, shops, schools, churches, etc., but, to give the clinical Health Centres full advantage of ideal conditions, it was assumed that the population grew in equal density over a large area. Two different sizes of panels are studied, one limited to 5,000 persons and the other to 4,000. These figures are chosen because it is doubtful if a greater number than 5,000 will be allowed per doctor in the immediate future, and, on the other hand, the figure of 4,000 appears to be the minimum number which makes aetiology a worth-while study (Figs. 1 and 2).

These histograms illustrate that, no matter at what period of development of the clinical Health Centre the epidemic of 1943 had occurred, the incidence of influenza as reported by the staff would have been much the same. There would, however, have been a persistent decline in the *apparent* incidence of colds as the size of the centre grew. If the epidemic had occurred in the time of the small township with a single doctor, he might have regarded it as an epidemic primarily of colds, with some influenza. If, on the other hand, it had occurred when the town had developed to such an extent that ten doctors were required at the clinical Health Centre, it would have been accepted as an epidemic of influenza accompanied by some increase in colds. It will be noticed that, with diminishing densities of population, this variation in the apparent type of the epidemic becomes more marked.

MEDICAL SERVICES IN CONTINENTAL COUNTRIES

7.—SPAIN

Spain has had a Ministry of Health, but under the new regime, apparently, public health is a department of the Ministry of the Interior. The Director-General of Public Health, who is himself a medical man, holds a non-political appointment. He is selected from among public health specialists. Under him are the provincial and municipal officers of public health, who are appointed to their respective posts as a result of examination. On entering the service the newly qualified man is usually appointed to a village, where he is paid a small salary by the local authority but also undertakes private practice. In course of time he is promoted to higher categories and may become a provincial inspector of public health. One such official holds office in each of the 49 provinces of Spain.

All this arrangement of offices in the public health service is in medical control. The Spanish medical profession, loosely organized as it is, has been very successful in insisting that medical questions should be determined by medical people and in preventing the interference of any lay bureaucracy. Any appeal by a public health officer or any dispute which arises is decided by a medical tribunal, except in the last resort, when the matter may be taken to a civil court. In the same way, if there is a complaint against an officer the municipal authority making the complaint refers it to the provincial inspector of public health, and if no satisfaction is obtained from him, to the Director-General, and only if this recourse fails does the matter go to the courts.

In taking charge of a village the first duty of the appointed officer is the medical care of the poor. For this he is paid at a scheduled rate. It is only a small sum which he receives in respect of his office—perhaps, in a village of 3,000 or 4,000 people, £150 a year—but he is allowed also to practise for private fees. It is the local authorities who decide what level of income gives title to free medical service. After serving in a small village the medical officer may be promoted to a larger one or to a town, where exactly the same plan holds good. In addition to his clinical work he fulfils the usual functions of a medical officer of health and undertakes any duty in the sphere of forensic medicine which may be necessary. In smaller places he may have to perform certain specialist services; in the larger towns specialists are available at the hospitals.

Hospitals in Spain belong to the State, to the province, or, in the large cities, to the municipality, but they all receive subsidies from State funds. The sense of communal responsibility for care in sickness as in other matters is strong in Spain. There are also a few voluntary hospitals under the Red Cross; these are maintained, not by voluntary subscriptions as we understand them, but by means which appeal more to the Spanish temperament, such as the proceeds of a lottery or a bullfight. Most of the hospitals are staffed by part-time medical officers. Indeed, the only hospitals in Spain which do engage whole-time consultants are the Red Cross hospitals. The employing body of the part-time staff of the provincial and municipal hospitals is the State, but here again the medical officer deals with medical superiors up to the Director-General, and not with any lay authority at all.

In Spain there are 27,000 doctors to a population of 24½ millions. They are organized in provincial "colleges" which are federated in a national association with representatives from each college on the controlling body. These colleges speak and act for the profession. They undertake on behalf of the doctor the collection of debts and negotiate in such matters as income-tax assessment. An argument over the amount of the doctors' fees would be determined by the local college. If a dispute went so far as the civil courts the college would provide expert evidence. The whole system in Spain is directed towards keeping medical matters in professional hands so far as possible, and it would be difficult for any man to carry on practice unless he had the support of the college of his province.

Health Insurance and a Capitation Fee

A good deal of medical practice in Spain is carried on through health insurance societies, some of which are large and powerful bodies. About 60% of the working people are said to be insured for health. They pay usually about four shillings monthly as premium, and for this they receive not only general practitioner treatment but consultant and specialist service as necessary, though not usually in-patient hospital maintenance. What is known in this country as funeral benefit is also included. Out of the premiums paid the general private practitioner may receive about 20%, so that a practitioner would need to have about 500 insured persons on his list to command an income of some £240 a year.

The medical student is assisted to a very large extent. Ever since medical teaching was instituted the way to the profession has been made easy for the poor student. Thus if a small farmer can find the money to maintain his son for the necessary years in a boarding house in Madrid or Valencia or other university centre, and can purchase his books, the young man may receive his medical education free.

Private practice is strongly entrenched in Spain, and the system is not likely to be exchanged, even under a totalitarian government, for any other. This is all the more noteworthy because many doctors are earning only a precarious livelihood. Let it be remembered that Spain is a poor country; that it has twice the area of the British Isles but only half the number of inhabitants; that although it has eleven universities a large proportion of its population is still illiterate; and that the feudal nature of land ownership has weighed down the small agriculturist (and agriculture is the mainstay of Spain's economic existence). But although a large proportion of Spanish people cannot afford to pay a private doctor and the medical profession is overcrowded the doctors are opposed to a State medical service. The only party which has put forward proposals of that nature is the Falangist party, and they have gained little or no support in spite of the tempting prospect of economic security for the doctor.

In 1941 the death rate in Spain was 18.7 per 1,000. The birth rate exceeded it only by the narrow margin of 0.9 per 1,000. Pathological services are available through local private doctors. There are municipal laboratories in the cities, and provincial laboratories to which specimens may be sent from the villages.

The writer of this article is indebted to the Spanish Embassy and to Dr. Martinez Alonso, an outstanding medical man of Madrid who has been in this country for some time, for many of the facts contained in it, but they must not be regarded as responsible for any inferences drawn from them.

FROM THE PRESS CUTTINGS

"This means that the B.M.A., while rejecting the administrative structure outlined in the White Paper, will approach the negotiations with the Minister of Health not on the basis of negative demands, but with a programme of concrete proposals."—*Evening Standard.*

"The profession are trying to plan the best medical service possible for all, while the Government are limiting their field to the provision of a service that will enable them to work the social insurance scheme. Everyone would agree that health depends a little on security, but few would place security before health."—From a letter in the *Times.*

LABOUR PARTY AND THE WHITE PAPER

The recent Labour Party Conference in London adopted without dissent a motion of the Socialist Medical Association welcoming the White Paper on a National Health Service as an essential part of the social security scheme for 100% of the people and urging the labour movement to support it and press for such improvements as would bring it into line with the Labour Party's own policy as expressed in its publication "A National Service for Health."

Dr. D. Stark Murray, in moving this resolution, compared the Labour Party's "statesmanlike document" on this subject, with the contradictory decisions made at the B.M.A. Representative Meeting during the previous week. If the Labour Party did not support the White Paper, he said, the opposition would whittle it down and make it unworkable. The opposition was of two kinds: first, the general political opposition to anything which embodied a social advance for the working classes of this country; and, secondly, the professional opposition, "and there you have reaction at its very worst." "We had the spectacle last week," Dr. Stark Murray continued, "of men speaking about freedom and democracy and putting up a plea which, to my mind, as one who sat through the whole of the B.M.A. conference, appeared an attempt to make the world safe for hypocrisy. There was one speaker who went so far as to say that the treatment for rheumatism when it occurred in the working-classes was to see that they went on working. That is the kind of reaction you get from some of my professional brethren whenever anything is suggested which would be for the benefit of the working-class. Harley Street has developed a new definition of democracy: "Government of the people by the doctors for the doctors!"

At the B.M.A. meeting, he added, local government was attacked in a way reminiscent of Mussolini. And what did they decide? That not until institutional and specialist services had been brought into the insurance service and had been in operation and well tried should they begin to consider the women and children of this country. There was never a bigger attempt to prevent advance than that attempt of the B.M.A. But the small clique who stampeded the B.M.A., while they began the conference with 80 votes, could muster only 27 on the last morning. The Questionary showed 60% of doctors in favour of a service for the whole nation, and he believed that the Labour Party in its health service programme could count upon the support of 80% of the younger doctors of this country. Without a proper health service for 100% of the population the people could not have the social security they desired. No social security scheme could be guaranteed to work without a health service. Their main point was that they believed, in the Labour Party, that health required one single standard of treatment, no division between "private" and "panel," a 100% complete service for 100% of the people.

The report of the National Executive of the party, which was adopted at the Conference, generally supports the Government plan, while admitting that it is an obvious compromise and deficient in some directions. The deficiencies of the White Paper are: (1) the failure to stress the importance of good food and housing, sound town planning, full employment, satisfactory conditions of work, and the right use of leisure as factors on which the promotion of health depends; (2) the absence of reference to the need for developing the industrial health service and linking it to the general health service and to the Ministry of Labour; (3) omission of mention of the need for many more nurses; (4) absence of reference to the requirement, as many more doctors will be needed, that medical education be thrown open to all classes, regardless of financial position; and (5) the lack of prominence given to medical and social research. The National Executive is in favour of full compensation for loss of practices; the money involved would be small in relation to the total cost of the service.

NURSING IN A NATIONAL HEALTH SERVICE

The memorandum on "The Place of Nursing in the National Health Service," which was published recently by the Royal College of Nursing and discussed, in the presence of the Minister of Health, at the College's annual conference in November, is to be the basis of negotiations with the Ministry. The negotiations are, we understand, to start at once.

The preamble to the memorandum states that the College approves the Government's intention to provide a health service for everyone, and regards the provision of a complete nursing service as its special target. This is very far from being the case at present. Few people realize to what extent the success of the health plan will depend on the number and quality of nurses available to staff the hospitals and clinics, to carry out preventive work, and to help educate the public on its full meaning and use.

Criticisms of the White Paper

The memorandum contains a number of criticisms of the White Paper. For instance, it is pointed out that the emphasis is almost wholly on a curative structure for sickness rather than on the promotion of healthy living. Again, though the College admits the administrative expediency of bringing the National Health Service within the framework of local government, members of the College maintain that the present proposals should be regarded as a short-term policy only, pending complete reorganization of the local government machine. It is also doubted whether the opinions of the advisory bodies to be set up by the Minister will carry sufficient weight with the local authorities concerned. Much depends on the Minister himself, and on the encouragement he gives to the new bodies to initiate schemes of their own as well as advising on schemes submitted to them by others. Lastly, representation of the nursing and midwifery services on the central and local health councils is quite inadequate for services involving something like a quarter of a million workers. The health councils, being predominantly medical, would have neither the time nor the knowledge to deal with the many problems which arise in the nursing and midwifery field. The College considers, therefore, that the Minister should set up an Advisory Council on Nursing and Midwifery.

The Hospital Services

The hospital, says the memorandum, is the basic training of the nurse, and reorganization of hospital services must ensure that this basic training is not only safeguarded but improved. In the words of the Goodenough Report on Medical Schools, "the spirit of education must permeate the whole health service," and the regrouping of hospitals offers an excellent opportunity for introducing that wider basic training recommended by the Horder Committee on Nursing Reconstruction—a training which would introduce the student nurse to many branches not hitherto covered in her curriculum, such as the nursing of the chronic sick, mental and infectious diseases, and tuberculosis. The memorandum has other suggestions to make: for example, more privacy for patients in hospital wards, less congestion in out-patient departments, regular bus service for out-patients and patients' relatives, ambulance facilities for taking discharged patients to their homes, better classification and institutional care for the chronic sick. Much of the care expended in hospital is wasted for lack of follow-up work after the patient's discharge.

Health Centres

The College has in mind much more comprehensive functions for health centres than the grouped medical practices outlined in the White Paper. "The health centres should not only be concerned with the physical health of the people but should be a centre for all educational and recreational activities which have a bearing on health." Social workers, district nurses, and health visitors have their place in the health centre, which should run its own service of "home helps." The medical examination of juveniles for industry might well be carried out at the centre, where all relevant information would be accessible; the centre might also provide mobile clinics to serve the smaller factories in the locality. The College considers the exclusion of an industrial health service from the national scheme to be a grave weakness.

Home Nursing and Care of the Aged

The "full home nursing service" mentioned in the White Paper, states the memorandum, should not be limited to district and visiting nursing, but should include full-time nursing in the home, day and night if necessary. The present wide employment of private nurses will be beyond the means of most people in future, but the scope of district nursing might be widened to include whole-time nursing, or, alternatively, local authorities might provide "pools" of nurses at present engaged in private practice to meet local emergencies, such nurses to be employed under nationally agreed scales and conditions of service.

No health plan would be complete, the memorandum concludes, which did not contain plans for the grouped housing, in homely surroundings, of people who, unaided, cannot entirely look after themselves and yet wish to retain a measure of independence. The College considers that the experienced State-registered nurse has a leading part to play in the organization and administration of communities for old people.

Correspondence

Medical Demobilization

Sir,—In the *Supplement* of Dec. 23 (p. 173) you print a letter from Capt. P. T. Davies, who has obviously misunderstood the phrase "go into reverse" in the statement on demobilization published by the Central Medical War Committee. Capt. Davies has erroneously concluded that the return of medical officers from the Forces under the Government's re-allocation of man-power scheme will be arranged on the principle of "last in, first out." This is by no means the case. On the contrary, as is indicated in your editorial footnote, it is length of war service coupled with age which will as a general rule determine priority of release.

There will, however, be a limited number of cases in which it will be considered necessary, on the ground of urgent civil need in particular areas, to apply for individual medical officers to be transferred from the Forces out of their turn—that is, before they are due for release according to the age-service formula. Applications for such transfers will be considered by the Central Medical War Committee, which will make recommendations to the Service Departments. It is in connexion with this part of the scheme (Class B of the White Paper) that the phrase "go into reverse" was used; and all that is meant by this phrase is that the machinery of the Central and Local Medical War Committees, which was set up primarily for the purpose of arranging the recruitment of doctors to the Forces, will be used to arrange the opposite process of return from the Forces, so far as transfers in Class B are concerned. There is no reason to suppose that men transferred in Class B will normally be men with short periods of service, and the words quoted by Capt. Davies were not intended to convey any such meaning.—I am, etc.,

H. S. Souttar,
Chairman, Central Medical War Committee.
London, W.1.

What's in a Word?

Sir,—The summing up by the Chairman of Council (Dec. 10, p. 165) of the four days' deliberations and argument of the A.R.M. is masterly in its brevity and its clarification of the kaleidoscopic nature of the 370 motions on the White Paper. Most of us will find it difficult to do otherwise than approve of the general conclusions arrived at.

I would venture, however, to draw attention to a tactical error in the use of one word, which seems to me to weaken our whole position and is likely to lead to a misunderstanding on the most vital issues at stake. I refer to the use of the word "wish" in the penultimate paragraph dealing with some of the most fundamental objections to the Government's proposals. It reads as follows: "We have stated emphatically that we do not *wish* to be employed by local authorities, etc. . . ." Surely the intention is, and the paragraph should therefore read, that "We have stated emphatically that we refuse absolutely to be employed by local authorities. . . ." The word "wish" suggests a mild protest but leaves the matter apparently still open to argument and negotiation, whereas the fact is that, in regard to control by local authorities, civil direction, whole-time salaried service for general practice, we are adamant and refuse absolutely.

The Chairman of Council in his summing-up expressed the Council's welcome of "ginger from within." It is to be hoped therefore and urged that the Council in its forthcoming conversations with the Government will not wait upon the Minister with "wishes" and pious hopes but face him with minimum demands which must be satisfied as a prerequisite to any negotiations.—I am, etc.,

Oxford. J. Frankland West.

The Ministry of Health and Radiology

Sir,—I trust a storm of indignation will sweep the profession upon reading and considering the implications of the advertisement in the *Journal* of Dec. 16 (p. 12) by the Director of Establishments, Ministry of Health: published on the very day you report the proceedings of the A.R.M., so soon does the bleak complexity of the political plan behind the White Paper unfold itself.

It would appear that, presupposing the continued existence of the E.M.S. hospitals under its central control, the Ministry of Health already assumes to itself the right to decide whether or not a fully qualified doctor may pursue a course of postgraduate study in the specialty of his choice and thereafter offer himself for examination. To the successful candidate the Ministry offers the "specialist" a salary not at all removed from that paid to a technical assistant in the same Department.

Many questions immediately spring to mind, not least those concerning the future status of the examining bodies—whether university or Royal College or learned society—and the General Medical Council. It is an open secret (not readily forgotten) that in discussions with a former Minister of Health the representatives of the profession utterly rejected a Ministerial proposal which would have had for its effect a transference of the right to grant licences to practise from the General Medical Council to the Minister of Health. Is this departure of the Ministry the first step in achieving the same result by another means?

One wonders what will happen if unfortunately the autonomy of the voluntary hospitals is destroyed. One is intrigued to know which will be the next specialty involved—physiotherapy, ophthalmology, gynaecology, surgery, medicine, and so on down to practice in the Health Centre. One asks if the effect of these examinations will be to raise or lower the standard of radiology.

A couple of years ago I would vehemently have refuted any suggestion that the Ministry of Health would one day conduct its own examinations. Perhaps the Faculty of Radiologists can explain the circumstance.—I am, etc.,

Maurice Wigfield.
Watton-at-Stone, Hertford.

H.M. Forces Appointments

ARMY

War Subs. Lieut.-Col. (local Brig.) R. O. Ward, D.S.O., O.B.E., M.C., T.D., R.A.M.C., has relinquished the local rank of Brig.

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. B. C. O. Sheridan, M.C., having attained the age for retirement, is retained on the active list supernumerary to establishment.

REGULAR ARMY RESERVE OF OFFICERS

Col. K. Comyn, late R.A.M.C., has ceased to belong to the Reserve of Officers on account of disability.

LAND FORCES: EMERGENCY COMMISSIONS

Royal Army Medical Corps

Major D. Ross, M.B.E., T.D., has relinquished his commission on account of disability and has been granted the honorary rank of Lieut.-Col.

War Subs. Capts. S. Mark, J. E. B. Elliott, L. Bapty, M.C., R. Morton, S. Canter, O. V. Jones, and P. Cosgrave have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

Lieut. Y. M. Dervish has relinquished his commission on account of disability and has been granted the honorary rank of Capt.

To be Lieuts.: E. Shephard, B. Appel, A. W. Banks, R. L. Batten, J. C. Campbell, A. S. Carruthers, R. M. Chambers, J. S. Chapman, F. Denny, M. C. H. Dodgson, E. R. Edmunds, J. C. Forfar, M. T. Gillies, K. M. Gough, T. P. Grant, C. Harris, J. Hinchliffe, A. R. Hyslop, W. H. W. Jayne, J. M. Johnstone, T. D. Kellock, J. V. Kent, F. R. S. Knight, J. L. MacKenzie, K. M. Mackenzie, S. A. M. Stalker, S. J. Steel, J. Stohlner, M. C. Stone, I. G. Thomson, J. S. Thorburn, D. A. Tilsley, G. R. Venning, G. R. Wadsworth, R. Walkingshaw, H. E. R. Wem, R. H. Seville.

BRITISH MEDICAL ASSOCIATION

CONFERENCE OF RADIOLOGISTS

A Conference of Radiologists, arranged jointly by the Radiologists Group of the B.M.A., the Faculty of Radiologists, and the British Institute of Radiology, will be held at B.M.A. House, Tavistock Square, London, W.C.1, on Saturday, Jan. 20, at 10 a.m. All radiologists are invited, whether members or non-members of these bodies. The agenda will be sent to members; radiologists who are not members of any one of the three bodies may obtain an agenda on application to the Secretary of the B.M.A. at the address given above. The business of the Conference will be to consider radiological questions arising from the White Paper on a National Health Service.

POSTGRADUATE NEWS

A series of postgraduate lectures will be given in the West Medical Theatre of Edinburgh Royal Infirmary on Thurs., Jan. 18 and 25, Feb. 8, 15, and 22, and March 8, 1945, at 4.30 p.m.

DIARY OF SOCIETIES AND LECTURES

Royal Society of Medicine.—*Tues.*, 2.30 p.m., Section of Psychiatry. *Wed.*, 4.30 p.m., Section of Physical Medicine.

Medical Society of London, 11, Chandos Street, W.1.—*Mon.*, 5 p.m., Pathological Meeting.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTHS

Boney.—On Dec. 28, 1944, to Hilary (*née* Long) M.B., F.R.C.S., wife of Knowles Boney, M.D. M.R.C.P., Lieut.-Col., R.A.M.C., a son.

Howells.—On Dec. 8, 1944, at County Hospital Bangor, to Ola (*née* Brown), wife of Lieut. J. G Howells, R.A.M.C., a son—John David Barry

MARRIAGES

Clift—Newell.—On Dec. 14, 1944, at Kirk Hammerton, Yorkshire, Arthur F. Clift, F.R.C.S., to Dorothy C. Newell, M.B., Ch.B.

MacGregor—Morris.—On Nov. 18, 1944, in Madras, Malcolm Eliot MacGregor, Surg. Lieut. R.N., to Marigold Ancred Morris, R.N.V.A.D.

Scott—Hudson.—On Dec. 28, 1944, at Twigworth Church, Gloucester, Wing Cmdr. Ronald Leslie Scott, B.Sc., M.B., Ch.B., R.A.F., son of Mr and Mrs. David Scott of Glen Rosa, St. Andrews Fife, to Gwendoline Mary, daughter of Mr. and Mrs. Arthur Hudson of Kingsholm, Gloucester

DEATHS

Kelynack.—On Dec. 23, 1944, Theo N. Kelynack, M.D., M.R.C.P., J.P., of 9, Arden Grove, Harpenden, aged 78.

McRobert.—In a road accident in England in December, 1944, Ronald, medical student at Bart's, only son of Lieut.-Col. G. R. McRobert I.M.S., and Mrs. McRobert, Madras, aged 2 years.

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY JANUARY 13 1945

THE L.C.C. AND THE NATIONAL HEALTH SERVICE

WELCOME TO THE GOVERNMENT'S PROPOSALS

The London County Council, with Mr. Somerville Hastings, F.R.C.S., in the chair, at its meeting on December 19 debated the White Paper on a National Health Service, and passed a resolution welcoming the Government's proposals as representing a considerable advance towards a full health service for the people which could, over a period of years, be built up, improved, and developed with increasing advantage to the community.

The debate arose on a long report presented in the name of Lord Latham, the leader of the council. The administrative county of London will form a single unit for the purposes of the service, and it is assumed that the county council will be constituted the planning and administering authority. Maternity and child welfare work, tuberculosis dispensaries, and epidemiological inquiries will be delegated to the metropolitan borough councils. The authors of the report consider that the salaries and conditions of service of the medical staff of the borough councils should be laid down and approved by the county council. The council agreed to a recommendation that no right of nomination or appointment by professional or other bodies to membership of any committee of the council charged with the administration of the scheme could be acceptable. It was considered "not unlikely that the question of direct representation on joint authorities would be pressed by certain interests."

On the provision for hospital and consultant service the question was raised how far national insurance would confer on an individual the right to demand free treatment at any hospital or clinic within the plan. It was considered that it should be made clear whether settlement or residence was immaterial. With regard to the financing of voluntary hospitals the council considered that the principle of direct grants being made by the Minister and of the standard payment being determined by him, without reference to the joint authorities, was undesirable, and a recommendation was agreed to that if it was decided that any payments to voluntary hospitals should be made direct by the Government, the payments to each voluntary hospital should be related solely to the particular services rendered. The feeling was that, as voluntary hospitals are not to be compelled to come into the plan, there should be safeguards in any scheme which permits the pooling of Exchequer payments in order to avoid money going to a voluntary hospital which for any reason cannot be an effective part of a local scheme or which would require undue expenditure to make it efficient.

Health Centres

On health centres the comment was made that if doctors could "opt" for centre or separate practice at the outset it would not be known how many wanted to be centre doctors until the scheme was about to start, particularly as many young doctors from the Services would want to enter the new scheme on demobilization and their wishes could not be ascertained in advance. The lag even for structural alterations of existing premises would probably extend over months. Where were such doctors to practise in the meantime? "All this points to the desirability of consulting local doctors as soon as a Bill is passed, and a scheme prepared on which a start can be made in any area where the existing doctors are likely to wish to work in a centre and where a centre is likely to be needed."

Another comment was that if the dual system under which general practitioners will be engaged partly in group practice and partly in private is to be permitted, steps should be taken to ensure that patients using the public service are not at a disadvantage as compared with private patients. The report stated that it would probably be very difficult to disabuse certain people of the belief that better service would be given to those who paid for it as a separate item of private practice. Again, what was to be done in the case of a person who preferred to pay for his own family doctor treatment but could not pay for consultant or private ward treatment? The local committees of the Central Medical Board would no doubt be available for the settlement of disputes relating to the family doctor service.

On the question of compensation reference was made to the fact that the setting up of a general practitioner service would bring about the disappearance of the council's district medical service, and that questions of compensation might be anticipated here, particularly in view of the fact that certain district medical officers are still senior poor law officers. The need for a comprehensive inquiry into the superannuation aspects of the new scheme was stressed.

In Praise of Municipal Hospitals

Mr. Reginald Stamp, chairman of the Hospitals and Medical Services Committee of the council, said that of 2,500 hospitals in the country, the municipalities owned 1,500, and those among the largest, while of the 1,000 voluntary hospitals a considerable number were very small indeed. In the L.C.C. the number of municipal hospital beds was 37,202, as against 15,000 in the voluntary hospitals, and the services given in the municipal hospitals outnumbered in almost every department those given in the voluntary. Moreover, the L.C.C. contributed to the voluntary hospitals a sum of £340,000 a year. He appealed to the voluntary hospitals to "unbend a little," and come into co-operation with an authority like the L.C.C. Given such co-operation, the L.C.C. could so link the various local services together that the right service was available at the right time and in the right place.

Mr. J. W. Bowen, chairman of the Mental Hospitals Committee, considered that the Government scheme was wise in its provisions. The proposals did away with any suggestion that mental health should form an isolated service. There was at one time a distinct danger that mental health might be excluded or not referred to in this general scheme. The local authorities who had the main charge of mental treatment had for long carried out their services with marked efficiency and great concern for the patient. The L.C.C. had made a valuable precedent by linking together its mental health and public health administration under the direction of one department. He hoped that the Government would revise the lunacy and mental deficiency law without delay in order that detailed proposals for including mental health services in the comprehensive scheme might be formulated.

From the opposition benches Dame Barrie Lambert, formerly chairman of the Hospitals and Medical Services Committee, commented upon the delay in presenting this report to the council. The White Paper appeared in February. It was at first acclaimed as promising a marvellous piece of legislation and it had a wonderful "press," but a month afterwards everybody was damning it, and its only friend left was the L.C.C. Everybody knew that many of the proposals of the White Paper must be scrapped. She read from the report in the *British Medical Journal* the statement of the Chairman of the B.M.A. Council to the Annual Representative Meeting that the idea of joint boards was likely to be dropped. She welcomed this, because she had seen in the idea of the joint board the possible absorption of the council's services in a still larger authority, and just as Mr. Churchill had no desire to assist in the liquidation of the British Empire, so she had no wish to be associated with any kind of liquidation of the fine service which had been established in London. She felt that a great deal could properly be delegated to the metropolitan borough councils, especially in relation to the tuberculosis services, given full co-operation on the part of such councils.

Dame Barrie moved, and Miss Vickers seconded, that the following recommendation be substituted for one brought forward by Mr. Reginald Stamp:

> That the Council is satisfied that if the dual system under which general practitioners will be engaged partly in group practice and partly in private practice is

permitted, the medical profession can be trusted to carry out their duties in such a manner that patients using the public service are not at a disadvantage.

The original recommendation had it that if the dual system was permitted steps should be taken to ensure that there was no disadvantage to patients using the public service. Dame Barrie Lambert's amendment was lost, 18 voting in favour and 47 against.

As stated, the various recommendations were adopted, and the view appeared to find general favour that the scheme should be ready, if possible, before demobilization, so that men and women returning from the Forces should feel that something had been done to provide a better England, and returning doctors could be offered posts without having to find capital to purchase a practice. But the note of caution was sounded that the time factor must be taken into account, and that even on the administrative side the shortage of staff for undertaking a task of such magnitude would probably cause delay, so that it might be desirable to bring in the scheme by stages.

MEDICAL SERVICES IN CONTINENTAL COUNTRIES

8.—NORWAY

[The writer is indebted to Dr. Karl Evang, Director-General of the Norwegian Public Health Services, Royal Norwegian Ministry of Social Welfare, now in London, for the information contained in this article.]

Public Health Administration

In Norway the State directs the more important parts of the public health service; local agencies throughout the country have their policies outlined at the centre, but within that framework they have independence and initiative. The public health service is a branch of the Ministry of Social Welfare. At its head is the Director-General of Public Health (Dr. Karl Evang), under whom are a number of departments, including one for clinical matters, another for drugs and medicines, a third for the administrative arrangements for the prevention and treatment of tuberculosis, a fourth for the provision for cases of mental disorder.

The State Institute of Public Health is a Rockefeller benefaction. It furnishes the central health authorities with a first-class laboratory for bacteriological tests, serum tests, and analyses of water and foods, and at the same time manufactures vaccines and conducts research. The members of the medical faculty of Oslo University are required to give the Director-General expert assistance. Each of the twenty provinces in Norway has a chief public health officer, and the districts into which the provinces are divided are also in charge of officers. In each of the municipalities it is required that there should be a Board of Health, the chairman of which is the local public health officer or another doctor employed for the purpose, while the members include a number of local councillors and others. These municipal boards of health enjoy a good deal of autonomy, but there is an appeal from their decisions to the Ministry of Social Welfare. They supervise all the important hygienic services, the control of tuberculosis, the inspection of housing conditions, and other matters which fall to a sanitary administration. They issue regulations which constantly extend and supplement the general law. It is claimed for them that they represent a successful attempt to introduce local democratic management into the public health system.

Only in the large cities is the public health officer a whole-time officer of the authority. Generally he is also engaged in private practice and derives only part of his income from the State for his public health administrative work. At present Norway is divided into 378 public health districts, most of them rural.

Whilst State medical care and the public health system has been developing in Norway four national voluntary health organizations have come into existence. These are the Red Cross, with about 100,000 members; the Women's Voluntary Health Organization, with about 110,000 members; the National Association against Tuberculosis, with 150,000 members; and the Norwegian People's Relief, with about 170,000 members. There are also smaller bodies, such as the People's Health Association, the Mental Hygiene Society, and the Norwegian First-aid Society. The larger organizations receive income directly and indirectly from public funds and co-operate closely with the health authorities.

Hospitals

In 1937 Norway had 391 hospitals, with a total of 26,000 beds. This number included 7,000 beds for mental patients and 6,000 for the tuberculous. An endeavour has been made to develop the hospital system in such a way that the more complicated cases can readily be transferred from the small local hospitals to the large central ones. The smaller hospitals are encouraged to be first-aid centres or observation stations. More than 80% of the hospitals are publicly owned and operated, either by the State or by the local authority. The private hospitals are for the most part conducted by voluntary health organizations, like those already named, but all are subject to supervision by public health authorities. The patient's expenses are paid either by the patient himself or by the State, or, most often, by the health insurance administration. A patient in a public hospital receives exactly the same treatment no matter whether he is a private, an insured, or a poor relief patient. It is medical considerations only which determine whether he has a private room.

The hospitals have a regular staff of medical officers on fixed salaries and working whole-time. Private practitioners do not usually have the opportunity of continuing to treat their patients in hospital, though in some of the smaller hospitals there is a system whereby local practitioners may hold temporary positions on the staff. Two large general hospitals at Oslo as well as a number of small special hospitals form part of the medical teaching system of the university. Plans for establishing a second medical school at Bergen were being prepared before the war.

Health Insurance

Norway introduced a compulsory health insurance system in the same year as Great Britain. It was for wage earners below a certain income level. It has been extended until by 1940 about two-thirds of the total population of Norway came under this system. Shortly before the war a Bill was drafted, and would probably have secured a majority in the Storting, under which all Norwegian citizens would be covered. The expenditure on sickness insurance before the war was 65 million kroner (about £3,300,000 on the pre-war value of the krone), of which about 15 million represented doctors' fees.

The insured person and his family have the right to free medical attendance by general practitioners and specialists, free treatment in hospital for 26 weeks (or 39 weeks in the case of tuberculous and cancer patients), physiotherapy, dental treatment, and financial allowances for maternity, among other benefits Compulsory members are divided into income groups and pay in proportion to their income, the member himself paying 6/10ths of the premium, the State 2/10ths, and the authority and the employer 1/10th each. A class of voluntary members pay 7/10ths themselves, the State 2/10ths, and the authority 1/10th Sickness insurance is administered by local bodies elected from the county councils.

It has been possible to combine virtually universal compulsory health insurance with freedom of choice of doctor and freedom for the doctor to practise where he chooses. Most doctors, both general practitioners and specialists, derive the larger part of their income through the health insurance system, in which they are paid, not on a capitation rate, but according to the amount of work they do. The consultation fee is the basis of the income, and to that is added a fixed tariff for special examinations. There is no limit to the number of insured persons a doctor may accept

A person in Norway who has need of medical advice or treatment can always consult a doctor and, if necessary, receive treatment in hospital. In most cases the treatment will be under the insurance system.

The Medical Profession in Norway

In 1939 Norway had about 2,400 registered medical practitioners, one for every 1,250 inhabitants; about 10% were women. Until the German occupation which resulted eventually in the closing of the university, about 100 student qualified each year. The medical training occupies from 7 to 7½ years, and a most Norwegian youths have not completed their college course until the age of 21 or 22, the young doctor is usually approaching 30 before he can start in practice. Emphasis is laid on giving the students an all-round medical education and no specialization is begun during this period of undergraduate study. No one is allowed to describe himself as a specialist unless he actually possesses th authorization of an expert board of medical men elected by the specialist branch of the medical association.

There are about 1,000 midwifery districts, each served by a district midwife who receives a small regular salary, two-fifths of which is paid by the State two-fifths by the province, and the remaining one-fifth by the municipality. She also derives some income from th health insurance and poor relief funds and to a small extent from privat patients. On the basis of present birth statistics there are about 27 births pe midwife annually.

Norway has made great strides in combating disease. The ordinary epidemic diseases no longer offer any severe threa Doctors are required to report all case of epidemic infection. the patients are isolated in hospitals, and all expenses in connexion with isolation and treatment are covered by public funds. Tuberculosis is the greatest single hygienic problem, though during the present century tuberculosis as a cause of death has dropped from the first to the fourth place, being preceded by cancer, bronchitis, and pneumonia, and infirmities of age. Bovine tuberculosis has, practically speaking, been eradicated. Only two other countries—the Netherlands and New Zealand—show higher figures for the average span of life. The total mortality dropped from about 20 deaths per 1,000 inhabitants in 1840 to 15 in 1900 and 10 in 1935. Deaths due to tuberculosis declined by about two-thirds during the first third of this century. Before the present war Norway was one of the group of countries (Netherlands, New Zealand, and Australia being the others) which showed the lowest infant mortality rates in the world.

A COMPREHENSIVE HEALTH SERVICE

BRISTOL DISCUSSION CLUBS' PROPOSALS

In the Bristol area over a period of some weeks in the autumn of 1944 the discussion clubs comprising what is known as the Industrial Discussion Clubs' Bristol Experiment considered the Government's White Paper on a National Health Service, and each club wrote an independent report. The executive committee of the Experiment then met the Bristol Study Group of the B.M.A., and the various findings were summarized and discussed. The result is a memorandum "presented by citizens and doctors of Bristol" in which the summarized opinions are offered as a constructive alternative to the White Paper. It is signed by Dr. F. Milling, chairman of the B.M.A. Study Group, and Mr. C. E. Pegg, chairman of the Executive Committee of the Bristol I.D.E.C.

Two Points of Divergence

On only two points do the Industrial Clubs' conclusions differ from those of the B.M.A. Group. One relates to payment in the general practitioner service. The Clubs consider that all general practitioners in the national service, either practising in Health Centres or in very sparsely populated areas where a Health Centre would not be adequately attended, should be paid by the State. The B.M.A. view is that the medical profession desires that remuneration of private doctors should be by capitation fee. The other point is the financing of a State service. The Clubs maintain that the complete cost of running the service should be a national charge, payable from funds raised by Budget means, any increase being met by income tax. The B.M.A. view is that the cost should be met by individual contributions assisted by State grants.

The structure on which the two sides to the discussion are agreed is that the control of the service should be under a Minister of Health, and that the Ministry should be reorganized to administer all matters of national health at present handled by different Departments, and the non-health functions of the present Ministry reallocated elsewhere. The Ministry should be assisted by medical advisory councils to be elected periodically. These councils should have a right to tender advice to the Minister and afterwards to publish such advice, and all draft regulations should be referred to them. The country should be divided into regions covering natural hospital and medical areas, subdivided into local areas, both regional and local control to be exercised by a body elected as to half of it by the professional interests concerned and as to the other half by the lay electorate.

Nationalization of Hospitals

The memorandum comes down on the side of nationalization of all hospitals, the present management of hospitals, if efficient, to be retained. It is suggested that there should be "locality hospitals," one to every ten Health Centres, in which general practitioners could treat their own patients, or send them for examination, advice, or treatment, and also central hospitals, where specialists could carry out work beyond the scope of the "locality hospitals."

The medical, nursing, and domestic staffs of hospitals should be paid by the State, with standardized conditions of service for each category. A national ambulance service should be created, co-ordinating all the present varied organizations. There should also be a central bureau to give urgent information about available beds and ambulances. A directorate of hospital inspection should be established, and, finally, the out-patient departments should be drastically reorganized, greatly enlarged, and better staffed and equipped, and waiting time reduced.

Consultants and specialists should be paid by salary or sessional fees, or both, consultants to be selected from an approved list by regional boards and to come under regional control. Their numbers must be greatly increased. "Training to be free and open to all, enabling young men or women of any class to specialize." Specialized equipment should be the property of the nation and available to the whole medical profession.

The General Practitioner Service

On the general practitioner service there is agreement on the following points among others:

Increased remuneration to be given in unattractive areas.

Training facilities to be enlarged, enabling young men and women of any class to become doctors.

Numbers of doctors to be largely increased as soon as possible.

Maximum number of patients per practitioner, 2,000, the figure to be revised from time to time.

The family doctor principle to be maintained.

The N.H.I. system to be entirely superseded by the new scheme.

Health Centres to be under regional control.

Centres to undertake the whole of the work coming within the scope of general practice, including child welfare.

People to come automatically under medical supervision of the Centre or National Health Service doctor, preferably on a family basis.

No sale or purchase of Health Centre practices to be allowed.

Compensation to be considered on an individual basis by regional board.

Every person to have a right to annual medical examination, children at more frequent intervals.

Individual health dossiers to be compiled giving a complete medical history.

As for clinic services, the result of the discussions was to favour the incorporation of existing clinics in a State health service with a view to making them Health Centres or a basis for such centres. It was also the view that the school medical service should be incorporated in the State scheme and the children be automatically covered by Health Centre examinations. An industrial medical service, with full-time doctors in large works and groups of small works, should be a part of the scheme, as also should convalescent homes.

On the financial side the opinion was that the existing funds of the N.H.I. scheme at present held by approved societies and other bodies on behalf of their members should revert to the Exchequer so as to be available for the health of the people for whom they were provided. Foundation funds, gifts, and legacies to hospitals should be pooled and devoted to the maintenance of research institutions.

What's in a Word?

SIR,—I agree with Dr. Frankland West that the intentions of the A.R.M. might have been more effectively expressed by a stronger word than the word *wish*. "We have stated emphatically that we do not *wish*. . . ." Nevertheless, this "emphatically stated" *wish* may carry no less weight than some expression of a more robust nature. The actual resolutions of the A.R.M. count, not my words describing them.—I am, etc.,

Birmingham H. GUY DAIN

The Health Service

SIR,—The upheaval caused throughout the medical profession by the Government's proposals for a health service is slowly becoming appreciated in political circles, but one thing now appears clear to most, and that is, that the present time is not ripe for the suggested full-scale health service as outlined in the White Paper. It also becomes quite clear that doctors in this country, and a large proportion now serving with the armed Forces, will resist any attempt to turn us into full-salaried local government civil servants. Let us be frank and strip the White Paper of trimmings; without doubt if these proposals were to go through as they are presently set out the profession would simply become in time part of another group of civil servants. The doctors do not want it, and when the public understand it more fully they will dislike it still more.

As to the doctors in the fighting Services, the directorates of the three Services may say, and in fact have stated, that serving doctors are at liberty to express their views on Service medicine and State medicine, but as one who saw service throughout the last war and again for some time in the present conflict with the R.A.F. medical service I know from personal experience that, except for those holding senior rank in these Services, the remainder (those who have to do the work) prefer to remain either anonymous or silent on these vital issues simply for fear of "reprisals." It seems grossly unfair that at a time like the present the opinions and views of these fighting men cannot be heard while an attempt is being made to force issues during their absence that must determine the future and destiny of the medical profession.

and essentially that of the younger members.

Therefore the letter signed by eight M.P.s, published in the *Times* on Nov. 16, introduced indeed a welcome note from the House of Commons, and may yet prove the seed for a practicable solution of many of our difficulties. Briefly, the letter suggests a reorganization of the medical services throughout the country in two stages (and here it would seem proper to add that the profession has been seeking such a reorganization for many years, but not on the lines as advocated in the White Paper). First, it is recommended that the hospital and consultant services throughout the country should be rearranged, with the latter paid for their services (whole and part time), but still left free to carry on private practice. There is a strong feeling that such a reorganization should be carried out on a regional basis, as for some long time advocated by the Nuffield Hospital Trust and fully described in their memorandum, published in 1941, entitled "A National Hospital Service." Secondly, for the present, extend the "panel system" both ways, but proceed no further until our doctors return from the fighting Services. When they have returned, but not before, let us all together consider and discuss the final reorganization for a general practitioner service, but do not let us commit the cream of the profession in their absence on service to something they may not desire, nor indeed perhaps be prepared to co-operate in. The Government would be wise to step cautiously, for there is no doubt the profession this time is aroused, remembering past and more recent injustices of panel practice legislation; it may be that on this occasion, having reached the boiling-point, the doctors are not likely to cool off readily, for they are not convinced that the Government's proposals are in the best interest of the sick.—I am, etc.,

London, W.1. NORMAN P. HENDERSON.

The N.H.S. Proposals from the Patient's Viewpoint

SIR,—I am not a medical practitioner but as I act as attorney to a number of doctors in the Services I beg the courtesy of a few lines in your esteemed *Journal*.

1. It appears that the great majority of general practitioners are against many of the proposals in the White Paper.
2. It appears that the majority of laymen are neither in favour of nor against the proposals.
3. It appears, however, that these proposals may be forced on the public as a result of the activity of a politically minded minority.
4. In my view this may be prevented if doctors distribute in their waiting-rooms pamphlets pointing out the disadvantages *to the patient* of the White Paper proposals if these are carried out in their entirety and to their logical conclusion.

Certain of these disadvantages are as follows:

(*a*) Centralization of surgeries (renamed clinics). This would mean longer journeys for the patient.

(*b*) Under group practice the patients will not be able to get the doctor whom they want when they want him, but will require to accept the doctor in attendance at the time of the visit.

(*c*) The doctor will be responsible to the State and not to the patient, who presumably will not be able to change his doctor. The patient will require to attend the doctor assigned to him however unsympathetic and however little faith the patient may have in the doctor. It is impossible to combine a free choice of doctor to the patient with a salaried service.

(*d*) When certifying, the doctor will need to remember that his duty is to his paymaster—the State—and not to the patient.

(*e*) When, as may happen in the future, all doctors are State employees it will be impossible to get a second opinion, and if a dispute arises with the State—e.g., over sickness or workmen's benefit—no independent opinion will be available.

There are, of course, certain advantages to the patient in the White Paper proposals, but we can rest assured that the supporters of the White Paper will do everything to bring these to the notice of the electors.—I am, etc.,

London, N.W. RAMSAY BROWN.

Local Authority Control

SIR,—In your report of the A.R.M. (Dec. 16) and your summary of the "main decisions of the Representative Body" (Dec. 23) you gave special prominence to the Woolwich resolution: "That the profession should not be controlled by the local authorities as at present constituted." This was accepted without discussion, as it was only a modification of the wording of Principle D. You omitted, however, to give even equal prominence to a more important motion by Newcastle-upon-Tyne to amend that Principle. The last sentence of Principle D as passed at the 1943 meeting was: "The profession rejects any proposal for the control of the future medical service by local authorities as at present constituted." The Newcastle amendment proposed that the words "as at present constituted" be deleted. This was carried.

The A.R.M. has asserted. therefore. that no reconstitution or modification of local authorities will make control by those bodies acceptable to the profession. That is a major decision, and goes much further than the Woolwich resolution. Our negotiators now have no authority to discuss changes in local authorities with the Minister, and must make that clear to him. They must, therefore, have alternative proposals to put before the Minister, and one of the most constructive proposals of the meeting was Dr. H. B. Morgan's. He suggested the formation of bodies incorporating the principle of Whitley Councils throughout the administrative structure. If Dr. Morgan would expand this proposal in more detail in the columns of your *Journal* he would be rendering a great service to the profession.—I am, etc.,

Bishop Auckland. A. H. PROCTOR.

FROM THE PRESS CUTTINGS

"The B.M.A. revealed then [at the 1939 annual conference] that they were prepared even for the minor problems of a wartime task—right down to petrol allocation. The phrase was: "We are organized for any emergency without financial consideration." Truly an efficient organization whose deliberations to-day must have great weight."—From the *Glasgow Citizen*.

"They have set up a Negotiating Committee, and will meet the Minister of Health, but they will meet him under instructions to preserve the essential freedom of the profession, and we would like to think that their attitude will be a salutary lesson, taken to heart in time by the Conservative members of the Coalition."—From the *Tablet*.

"In the long run responsibility educates; the more intelligent the members of an organization are the more they are stultified by rigid control from without or above, the more they are developed by responsibility coupled with freedom at all levels."—From *Time and Tide*.

BRITISH MEDICAL ASSOCIATION

CONFERENCE OF RADIOLOGISTS

A Conference of Radiologists, arranged jointly by the Radiologists Group of the B.M.A., the Faculty of Radiologists, and the British Institute of Radiology, will be held at B.M.A. House, Tavistock Square, London, W.C.1, on Saturday, Jan. 20, at 10 a.m. All radiologists are invited, whether members or non-members of these bodies. The agenda will be sent to members; radiologists who are not members of any one of the three bodies may obtain an agenda on application to the Secretary of the B.M.A. at the address given above. The business of the Conference will be to consider radiological questions arising from the White Paper on a National Health Service.

WOMAN MEMBER OF COUNCIL

The Council of the Medical Women's Federation has decided to recommend its members to support the candidature of Dr. Janet Aitken in the election of a woman member of Council by the women members of the B.M.A.

Branch and Division Meetings to be Held

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At West Park Hospital, Macclesfield, Sunday, Jan. 21, 11.30 a.m., Special meeting. Agenda: To consider Representative's report on A.R.M.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—*Tues.* and *Thurs.*, 2.30 p.m., Goulstonian Lectures by Lieut.-Col. C. H. Stuart-Harris: Influenza Epidemics and the Influenza Viruses.

ROYAL SOCIETY OF MEDICINE.—*Tues.* 3 p.m., Section of Pathology; 4 p.m., General meeting of Fellows *Thurs.*, 4 p.m., Section of Dermatology. *Fri.*, 5 p.m., Section of Obstetrics and Gynaecology: 6.30 p.m., Section of Radiology.

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE.—At 26, Portland Place, W., *Thurs.*, 3 p.m., Brig. N. Hamilton Fairley, F.R.S., A.A.M.C.: Chemotherapeutic Suppression and Prophylaxis in Malaria—An Experimental Study undertaken by the Malaria Research Unit, L.H.Q., Australia Followed by a discussion.

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m., Prof. C. F. W. Illingworth: Gastric Function in Relation to the Treatment of Peptic Ulcer.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTHS

HYLTON.—On Nov. 14, 1944, in Ahmednagar, India, to Dr. Lorna Hylton (*née* Petersen), wife of Major William H. Hylton, R.A.M.C., a daughter.

WILKINS.—On Jan. 2, 1945, at the Queen Elizabeth Hospital, Birmingham, to Margaret (*née* Roe, M.B., Ch.B.), wife of John G. Wilkins, a son.

MARRIAGE

VENNING—BARKER.—On Jan. 2, 1945, at St. Barnabas Church, Heaton, Bradford, by the Rev. Kenneth Kay, assisted by the Rev. A. Cumming, Geoffrey Richard Venning, B.M., B.Ch., Lieut., R.A.M.C., only son of Lieut.-Col. and Mrs. A. N. Venning, of Stoneycroft, Yateley, to Mary Ruth Barker, B.M., B.Ch., younger daughter of Col. and Mrs H. W. Barker, of 4, Oak Mount, Bradford.

DEATHS

HORSBURGH.—On Jan. 3, 1945, at his residence, Fallowfield, Ryde, after a short illness, Edward Leslie Horsburgh, M.D.Lond., B.S.

MOONEY.—On Dec. 29, 1944, suddenly, Annie Mooney, L.S.A., late Assistant Medical Officer of Health for Oldham and for many years School Medical Officer of the same Borough.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY JANUARY 20 1945

MEDICAL SERVICES IN CONTINENTAL COUNTRIES

9.—GREECE

Both general and special hospitals are well organized in Greece. There are hospitals attached to the University of Athens, other voluntary hospitals, municipal hospitals in the chief towns, and Red Cross hospitals. Many voluntary hospitals owe their existence to wealthy Greek families. Greeks who have made a great deal of money in trading abroad have found pleasure in establishing and endowing large hospitals in their native land. Thus it comes about that in Greece some of the finest hospitals are quite distant from the towns. A famous hospital for skin diseases was founded by funds provided by a number of Greek benefactors. Another example is the gynaecological clinic due to the munificence of Mme. Venizelos.

The hospitals are staffed by part-time officers. Whole-time clinical appointments are not favoured. It is strongly held that a clinician must have private practice if he is to avoid a groove. Moreover, a hospital appointment is regarded as carrying a prestige which is of assistance to the private practitioner. The only whole-time posts are the laboratory ones, and even the whole-time pathologists are allowed to do a certain amount of private work. Many of the university professorships also are part-time appointments.

The administrative and clinical sides of hospital work in Greece are sharply differentiated. The director or superintendent of the hospital is not a medical man. The members of the medical staff are engaged by a medical committee. Discipline, too, is retained in professional hands. Neither the Government nor a municipality can dismiss a physician if he is doing his work properly. Payment by patients, sufficient to cover expenses, is a general rule in the municipal and in some of the voluntary hospitals.

The public health service in Greece, including the epidemiological and immunological service, is well organized. There is a school of hygiene (Rockefeller Foundation), and a bacteriological laboratory in Salonika collaborates with the Pasteur Institute in Athens. Most of the medical officers of health are not well paid, and some of them, although technically whole-time officers, are allowed to carry on a certain amount of private practice. Local self-government is not developed in Greece as it is in Great Britain, and the central Government encroaches to some extent upon the municipal sphere.

General practice is on a free competitive basis. The Greek doctor is essentially an individualist, and the general shape of practice is not unlike that which obtains in Great Britain. The question of national health insurance has come forward, but has not developed into anything like the panel system we have in this country. It must be remembered that Greece is an agricultural country, agriculture employing more than half its six and a half million population. The consulting body consists of professors at the University of Athens and medical specialists at the hospitals. There is not the distinction which obtains in this country between general and consulting practice, and the requirements for university study and diploma are the same for both. Medical practice in Greece, as becomes the country in which the art of medicine was born, is of a high standard, involving seven years of preparation. The University of Athens has a famous Faculty of Medicine with (in 1938) four honorary professors, twenty-three ordinary professors, eight extraordinary professors, and thirty-eight lecturers. Attached to it are eleven institutes and thirteen clinics in associated hospitals. In normal times the number of medical students in the schools was about 1,800, and about 500 were examined each year. Doctors in Greece take a great part in Red Cross work. The head of the Greek Red Cross holds a position equivalent to the head of the Navy, Army, or Air Force. The organization is independent of the Government, and carries out a very large amount of work.

The Minister of Health is at the same time Minister of Social Welfare and Public Assistance. He is advised by a Medical Board, whose president is usually the professor of hygiene at the university, and whose membership consists of representatives of the university, the hospitals, and the general body of the profession. The board is at liberty to publish its views independently of the Minister.

For many years past Greece has had to deal with the refugee problem, and this has had considerable repercussions on its own health services. At a time when they were weary themselves with long fighting the Greeks had to receive suddenly a number of people, mostly helpless women and children, infinitely more wretched. Every kind of building had to be turned into a hospital. A large proportion of the refugee population had to be settled in parts of the country where malaria was endemic. Overcrowding also facilitated the spread of tuberculosis. Typhoid, paratyphoid, and dysentery had to be countered. Dispensaries were established in the villages. Distribution of quinine and medicines was organized. The services of public doctors were made available. The result was that a marked diminution in morbidity and mortality was shown in the refugee population and their resistance to infection improved.

But it is largely as a result of the refugee invasion that many hygienic reforms have come about in Greece. Many of the dispensaries formed originally for the refugees became part of the permanent structure of the health service. Education in hygiene is now a part of the curriculum in all Greek schools. All pupils are required to be vaccinated against smallpox, and a determined effort has been made to stamp out malaria and trachoma. The private doctor as well as the teacher takes part in health education. Tuberculosis showed signs of becoming a great danger, but an antituberculosis society was established in 1925, and an active tuberculosis campaign was begun under the joint auspices of the public health service, the Refugees Settlement Commission, and the Health Committee of the League of Nations. What setback there may have been during the present war cannot yet be stated. The death rate in Greece in 1939 was 13 per 1,000.

By decrees of 1923 Greek doctors are organized in State medical societies associated with the chief towns. The Medical Society of Athens was founded in 1835, the Association of Greek Doctors in 1906, the Pan-Hellenic Medical Society in 1925.

The writer would like to acknowledge the kind help given by Dr. A. P. Cawadias, president of the Greek Red Cross Executive Committee, in assembling some of the facts set out above, but he must not be regarded as responsible for the article.

Correspondence

Certification for Priority Milk

SIR,—The recently issued rules for certification for privilege supply of milk and eggs must cause the deepest concern to those of us who fear a bureaucratic supervision of the practice of medicine. In the case of tuberculous pleural effusion, enteric group of fevers, and bacillary and amoebic dysentery certification is taken out of the hands of the physician and placed in those of the tuberculosis officer and medical officer of health. Speaking of the country as a whole I think it will be accepted that the general physician, especially if he is on the staff of a voluntary hospital, has far more clinical experience in the differential diagnosis of these diseases and their dietary necessities than the tuberculosis officer or the medical officer of health. In fact the original diagnosis in the great majority of cases is made by the general physician.

The insistence by the Ministry of Food that these cases shall be certified only by public health officers raises the question of the motive of the Ministry responsible for the drafting of these regulations. It savours of the bureaucratic control of the practice of medicine that many of us fear most in a "State" medical service. The following motives especially should cause us concern:

1. The regulations have been framed without the advice or against the advice of any medical man with knowledge of medical practice in the country, or possibly by a Ministry official with no knowledge of medicine.

2. The integrity or ability of medical practitioners is suspected by the Ministry.

3. The Ministry wish certification to be done by a class of M.O.s who are under their influence or not entirely free agents.

I hope, therefore, that the strongest protests against these regulations will be made by the profession as a whole and by the B.M.A. in particular.—I am, etc.,

Canterbury. H. A. TREBLE.

General Practitioner Service: the First Stage

SIR,—Capt. Edward Cobb, M.P., in his advocacy of the development by stages of a National Health Service, states that the first stage should obviously be the planning and co-ordination of the hospital and consultant services. This view has the support of the President of the Royal College of Surgeons and other eminent consultants, and, rather to my surprise, of the Representative Meeting, although the approval by the last may have been due to a desire to stave off as long as possible unwelcome and undesirable interference with private practice.

But I humbly submit that this contention is wrong, and that the first stage necessary is the improvement of the general practitioner service and its better integration with the hospital and consultant services. The general practitioner is the doctor who sees the patient first. Any failure on his part—personal or due to lack of proper facilities for diagnosis and treatment—may lead to the patient suffering irremediable damage before the consultant is called in. How much of the chronic illness which forms so large a proportion of the conditions treated in hospital—estimated by American investigators to be as many as 84%—results from unsatisfactory early treatment? A book recently published by the Commonwealth Fund of America, *The Care of the Discharged Hospital Patient*, shows how many hospital beds and how much money can be saved by the efficient home treatment of these patients, and I submit that at least as satisfactory results would follow the development of a more satisfactory general practitioner service, differing, however, from the American experiment in that a large part of the improvement would be in the direction of cure instead of alleviation only.—I am, etc.,

London, W.8. HAROLD H. SANGUINETTI.

All Round the Clock

SIR,—I am in hearty agreement with the contents of Dr. C. A. Robinson's letter (Dec. 16, p. 166) deploring the long hours of duty of general practitioners, not merely in time of war but also in peacetime. We have for too long been the slaves of the public, who have come to expect and demand our services at all hours of the day and night, not excluding Sundays and holidays. General practice at least is nothing less than a refined form of slavery, not only for the doctor but in many cases for his domestic staff and others in his employ. He and they are not expected to eat, sleep, or have reasonable relaxation. No other profession and no business man would tolerate such a state of affairs, and one would think that the health and lives of patients demand the cool clear brains which only proper relaxation can give.

The fact is, that the medical profession is badly organized and the public badly trained. How long can we endure such a state of affairs? The death rate among doctors is 40% higher than among bank officials in the same social group, according to the Registrar-General's mode of classification. All this is preventable. After the age of 35 no doctor should be expected to get out of bed once or more during the night (and perhaps not be able to get off to sleep for the rest of the night) and then go on duty at 9 a.m. the following morning.

I suggest that no matter what system we general practitioners work under after the war, emergency squads of young men under 35 be appointed for all districts, whether town or country, to do night work in rotas; of course no day work. A doctor can elect to go out to a case at night if he wishes, or give advice or call on the flying squad. This would help to reduce the number of night calls which are made to allay anxiety in people suffering from "wind-up"; they will prefer to call in their own doctors during the day rather than a stranger during the night. Now when reform is in the air, let us strike a blow for our own liberties.—I am, etc.,

Hull. L. I. HARDY.

NEGOTIATING COMMITTEE

The Negotiating Committee held its first meeting on Friday, Jan. 12, at B.M.A. House. It consists, it will be remembered, of 31 members, and is representative of the British Medical Association, the Royal Colleges, the Scottish Corporations, the Society of Apothecaries, the Society of Medical Officers of Health, and the Medical Women's Federation. At the outset the committee elected Dr. H. Guy Dain as its chairman, Sir Alfred Webb-Johnson as its vice-chairman, and Dr. Charles Hill as its secretary. After a preliminary meeting in the morning, it met the Minister of Health, the Parliamentary Under-Secretary of State for Scotland, and officials in the afternoon. In general the Negotiating Committee, or subcommittees set up for special purposes, will be meeting the Minister and his colleagues weekly.

H.M. Forces Appointments

ROYAL NAVY

Surg. Cmdrs. R. W. Higgins, O.B.E., D. H. Kernohan, J. Hamilton, and J. C. Souter to be Surg. Capts.

Surg. Lieut.-Cmdr. J. G. Vincent-Smith to be Surg. Cmdr.

Surg. Lieut. (Emergency) M. Urie to be Surg. Lieut.-Cmdr. (Emergency).

Surg. Lieut. M. E. MacGregor has been transferred to the Emergency List.

ROYAL NAVAL VOLUNTEER RESERVE

Surg. Lieut.-Cmdrs. J. F. Corr, G. P. McCullagh, K. Forsythe, V.D., C. A. Mather, and J. F. Heggie to be Surg. Cmdrs.

Surg. Lieut. F. W. Paul to be Surg. Lieut.-Cmdr.

ARMY

War Subs. Major I. Fraser, D.S.O., O.B.E., R.A.M.C., to be a Consultant, and has been granted the local rank of Brig.

ROYAL ARMY MEDICAL CORPS

The initials of Lieut.-Col. C. H. K. Smith, O.B.E., M.C., are as now described and not as stated in a *Supplement* to the *London Gazette* dated Dec. 12, 1944.

Major S. P. Sykes has reverted to retired pay on ceasing to be employed, and is restored to the rank of Lieut.-Col.

Short Service Commissions.—Capt. R. H. Berry, from Supplementary Reserve of Officers, to be Lieut., and to be Capt.; War Subs. Capt. T. E. Cleghorn, from Emergency Commission, to be Lieut., and to be Capt.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major H. D. Lane, M.C., has ceased to belong to the Reserve of Officers on account of disability.

Capts. J. A. Brocklebank and C. M. Fraser, from Supplementary Reserve of Officers to be Capts.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Major R. V. Powell has relinquished his commission on account of disability, and has been granted the honorary rank of Major.

ROYAL AIR FORCE

Air Cdre. (Temp. Air Vice-Mshl.) A. Grant, C.B.E., K.H.S., to be Air Vice-Mshl.

Gp. Capt. (Temp. Air Cdre.) (Acting Air Vice-Mshl.) A. F. Rook, O.B.E., K.H.P., to be Air Vice-Mshl. (Temp.).

Gp. Capt. (Temp. Air Cdre.) (Acting Air Vice-Mshl.) T. J. Kelly, M.C., to be Air Cdre.

Gp. Capt. (Temp. Air Cdre.) K. Biggs, M.C., to be Air Cdre.

RESERVE OF AIR FORCE OFFICERS

Squad. Ldr. G. L. Burgess has relinquished his commission on account of ill-health, retaining his rank.

ROYAL AIR FORCE VOLUNTEER RESERVE

Fl. Lieut. R. O'Meara has relinquished his commission on account of ill-health, retaining the rank of Squad. Ldr.

Fl. Lieut. K. S. P. Blatchley has relinquished his commission on account of ill-health, retaining his rank.

Fl. Lieut. F. F. Sligo has relinquished his commission on appointment to R.N.Z.A.F.

Flying Officers J. M. G. Costello, G. L. Moore, R. Morris, W. F. Rogers, W. J. H. Sayers, J. W. Squire, D. C. Tennant, and A. M. M. Wilson to be War Subs. Fl. Lieuts.

WEEKLY POSTGRADUATE DIARY

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m., Mr. G. H. Macnab: Actinomycosis.

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE.—Mon., 4.30 p.m., Section of Odontology. *Tues.*, 4.30 p.m., Section of Medicine. *Thurs.*, 5 p.m., Section of Urology. *Fri.*, 3 p.m., Section of Epidemiology and State Medicine; 4.30 p.m., Section of Disease in Children.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTHS

DAVIE.—On Jan. 7, 1945, at Frogmore Nursing Home, Norwood Green, Middx., to Nancy (*née* Turner), wife of A. Brodie Davie, M.B., Ch.B., a son—Alistair Brodie.

DICKSON.—On Jan. 12, 1945, at Ardencaple Nursing Home, Nunthorpe, Middlesbrough, to Betty (*née* Wood), wife of David C. Dickson, F.R.C.S.Ed., of Upsall Grange, Nunthorpe, a son.

MACDONALD.—On Jan. 7, 1945, at Putney, to Anna (*née* Hovell), wife of Capt. I. D. MacDonald, R.A.M.C., a daughter.

MARRIAGE

BORTHWICK—BERRY.—On Dec. 20, 1944, at St. Andrew's Church, Poona, India, by the Rev. J. B. Primrose, assisted by Major Caddy, S.C.F., Robert Donnan Borthwick, Capt., R.A.M.C., son of Major W. S. Borthwick, T.D., and Mrs. Borthwick, Lee, London, to Margaret Eleanor Berry, Q.A.I.M.N.S/R., only daughter of Mr. and Mrs. William Berry, 59, Wellesley Avenue, Belfast.

DEATH

STEWART.—On Jan. 4, 1945, at 12, Norfolk Road, Lytham, Robert Stewart, L.R.C.P.Ed., L.R.C.S.Ed., L.R.F.P.S.Glas., D.P.H., aged 71 years, beloved husband of Elizabeth Stewart.

On Jan. 4, 1945, Dr. Charles Hill, Secretary of the B.M.A., addressed a large public meeting at Brighton on the White Paper, and on Jan. 17 he spoke at the Royal Philosophical Society at Glasgow. His future engagements include addresses to lay audiences at Lincoln on Jan. 22, at Harpenden on Jan. 26, at Oldham on Feb. 14, and to the Birmingham, Brixton, and Horsham Rotary Clubs. At a Foyle's literary tea on Jan. 30 he will give an address on "Doctors." Dr. Hill will also speak at a Division meeting at Grimsby on Jan. 22, and at a joint meeting of the Oldham, Ashton-under-Lyne, and Rochdale Divisions on Feb. 14.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY JANUARY 27 1945

WHITLEY COUNCILS

During the discussions on a National Health Service at the Annual Representative Meeting of the B.M.A. in December Dr. H. B. Morgan asked the Representative Body to consider the advisability of incorporating, in the administrative structure the principle of Whitley Councils. The Chairman of Council, Dr. Dain, promised that the Council and the Negotiating Committee would investigate the working of Whitley Councils, and consider whether the method could be adapted to the needs of the medical profession. As a preliminary we give below some account of the machinery of these councils.

The Whitley Committee

Whitley Councils derive their name from the Right Hon. J. H. Whitley, M.P., former Speaker of the House of Commons, who was chairman of a Government committee appointed in 1916 on relations between employers and employed. The historical development of the main industries of the country during the preceding century had tended to range employers and employed in two separate camps with apparently opposing and conflicting interests, and the years immediately before the war of 1914–18 saw much industrial unrest. The Government felt that the period of post-war reconstruction would provide an opportunity for improving their relationship, and it accordingly appointed the Whitley Committee with the following terms of reference:

1. To make and consider suggestions for securing a permanent improvement in the relations between employers and workmen.
2. To recommend means for securing that industrial conditions affecting the relations between employers and workmen shall be systematically reviewed by those concerned, with a view to improving conditions in the future.

Throughout its work the committee emphasized the community of interest of all engaged in a particular industry, and sought to base co-operation between employers and employed on the development on voluntary lines of the methods of collective bargaining that already existed in many industries. The Ministry of Labour defines collective bargaining as those arrangements under which the wages and conditions of employment are settled by a bargain in the form of an agreement between employers or associations of employers and workpeople's organizations. In the middle of the nineteenth century the trade unions were concentrating on improving the conditions of work of the workers, and by 1900 many of the staple industries had adopted the practice of collective bargaining. At the outbreak of war in 1914 a large section of industry was covered by agreements, mostly local, relating to wages and working conditions, and the Conciliation Act of 1896 had encouraged the formation of voluntary conciliation arrangements. The Munitions of War Act of 1915, which included temporary provision for national arbitration on disputes in munition work, showed the value of a speedy reference to arbitrators whose award was enforceable at law, though the compulsory character of the arbitration was accepted only as a war-time measure. Experience of the Act, however, encouraged the regulation of wages on a national basis through centralized organizations.

The immediate cause of the appointment of the Whitley Committee was the disturbance originating in the Shop Stewards' Movement, which sought by unofficial and militant action to secure for the workers control of industry, first in the workshops and ultimately in the country generally. The Whitley Committee proposed to satisfy the desire of the workers for a voice in the organization of industry by the development of joint negotiating machinery, and it expressed its conviction that a permanent improvement in the relations between employers and employed must be founded on something other than a cash basis. Broadly, it recommended the formation in well-organized industries of joint industrial councils, the appointment of works committees representative of the management and workers in individual establishments, statutory regulation of wages in badly organized trades, a permanent court of arbitration, and Ministerial authority to hold inquiries regarding disputes. The committee's five reports were favourably received by the organizations of employers and employed, and its recommendations were adopted by the Government.

The Whitley Machinery

The committee's first report, completed in March, 1917, dealt with those industries in which organizations representative of both sides already existed. It recommended that joint standing industrial councils should be formed in the several industries. The councils should consist of representatives of the associations of employers and workers, and should meet at regular and frequent intervals to consider matters of mutual interest. (A model for the functions and constitution of a Joint Industrial Council, taken from the *Industrial Relations Handbook* recently published (1944) by the Ministry of Labour and National Service, appears as an appendix to this article.)

The Whitley Committee also recommended the establishment of district councils, similarly representative of employers and employed, to provide local machinery for the joint councils. In recommending these national arrangements the committee added:

> "It is not enough to secure co-operation at the centre between national organizations; it is equally necessary to enlist the activity and support of employers and employed in the districts and in individual establishments. The National Industrial Council should not be regarded as complete in itself; what is needed is a triple organization—in the workshops, the districts, and nationally."

Accordingly, in its third report the committee considered in more detail the establishment of works committees to provide a recognized means of consultation between the management and the employees. The object of the works committees would be to give employees a wider interest in, and greater responsibility for, the conditions in which they worked, to enforce collective agreements negotiated nationally, and to prevent friction and misunderstanding. They would not interfere with regard to wages and working conditions which were the subject of negotiation through national or district councils.

Arbitration

The fourth report of the Whitley Committee dealt with the machinery for conciliation and arbitration. The committee was opposed to any system of compulsory arbitration and the prohibition of strikes and lock-outs pending investigation. It preferred that differences should be settled within the machinery of the joint industrial councils. It also recommended, as supplementary provision, that a standing arbitration council should be established to which differences of general principles and differences affecting whole industries or large sections of industries might be referred when the parties failed to reach agreement through their ordinary procedure and wished to refer the differences to arbitration. The recommendation was given legal effect in the Industrial Courts Act, 1919, which established the industrial court as a permanent and independent tribunal in no way subject to Government or Departmental control or influence. Its members, who are appointed by the Minister, include independent persons, representatives of employers and of workmen, and one or more women. The court may sit in divisions and the president may decide whether any case should be dealt with a single member or by several members.

Development of Joint Councils

The reports of the Whitley Committee received a general welcome, and during the period from January, 1918, to December, 1921, 73 joint industrial councils were formed. To-day there are 98 councils constituted in accordance with the recommendations of the Whitley Committee. A few of them exclude questions of wages from their functions. Among the matters dealt with are unemployment, restoration of trade, research and the collection of statistics, education and apprenticeship, welfare, health, safety, workmen's compensation, and transport facilities. The councils vary in size, the number of representatives ranging from a dozen to 70.

Of the 73 formed in the early years 17 broke down before the end of 1921. Some of the factors contributing to the breakdown arose from war conditions and from the transition to peace, and some involved difficulties of wage adjustments. Another cause was the ineffective organization of the industry concerned. Recently formed organizations were inexperienced in methods of negotiation, and some were reluctant to entrust their representatives with adequate authority. In other cases the employers' or the workers' side was represented not by a single organization but by a multiplicity of organizations whose jealousies and rivalries impeded the smooth working of the joint council. Another cause of failure was the divergence of interests among the constituent bodies of a council—for example, between large employers and small employers or between the town and country sections of an industry. Such factors, of course, need not necessarily have led to friction and failure, and difficulties were in fact overcome amicably in other councils. They show that the successful working of Whitley schemes requires not only the machinery but also the good-will of both employers and workers.

Non-industrial Schemes

In its second report the Whitley Committee suggested that State and municipal authorities and persons employed by them should consider whether its proposals could suitably be adapted for their purposes. They were found to be appropriate, and the list of existing joint industrial councils includes the National Whitley Council for the Administrative and Legal Departments of the Civil Service, six Government Departmental industrial councils, three Government trade joint councils, a Joint Co-ordinating Committee for Government Industrial Establishments, and seven joint councils for local authority non-trading services.

The National Whitley Council for the Administrative and Legal Departments of the Civil Service was formed in 1919 "to secure the greatest measure of co-operation between the State, in its capacity as employer, and the general body of civil servants in matters affecting the Civil Service, with a view to increased efficiency in the public service combined with the well-being of those employed; to provide machinery for dealing with grievances; and generally to bring together the experience and different points of view of representatives of the administrative, clerical, and manipulative Civil Service." The official side is composed of persons of standing, who may or may not be civil servants, including at least one representative of the Treasury and one representative of the Ministry of Labour and National Service, while the staff side is composed of persons of standing, who may or may not be civil servants, appointed by nine specified groups of staff associations. In each Government Department there is a separate departmental council allied to the National Council and functioning on similar lines, the staff side being composed of representatives of associations of staffs employed within the Department.

In 1936 a Civil Service Arbitration Tribunal was set up by agreement between the Treasury and the staff side of the National Whitley Council. It consists of an independent chairman, a member from a panel appointed by the Minister of Labour as representing the Chancellor of the Exchequer for the time being, and a member from a panel representing the staff side of the National Whitley Council. Its function is to deal with questions affecting the emoluments, hours of work, and leave of civil servants on which there has been failure within the Whitley Council to reach agreement by negotiation.

The National Joint Council for Local Authorities' Administrative, Professional, Technical, and Clerical Services (England and Wales) was established in 1919 and its constitution was amended in 1944. Under the new constitution the National Council consists, on the employers' side, of 15 members appointed by 5 associations of local authorities and 15 appointed by and from the employers' side of the 15 provincial councils, and, on the staff side, of 15 members appointed by 5 staff associations and 15 appointed by and from the staff side of the provincial councils. The provincial councils cover the whole of England and Wales. The representatives on the employers' side of each council are elected from the affiliated local authorities within the area, and the representatives on the staff side are chosen from among the five organizations represented in the National Council. The scope of the council covers all administrative, professional, technical, and clerical staffs except clerks of local authorities and officers with a basic salary exceeding £700 a year, and part-time officers. In the cases of clerks of local authorities and officers with salaries exceeding £700 it is permissible for the local authority and the officer to make a joint submission to the council.

The purpose of the National Council is "to secure the largest possible measure of joint action for the consideration of salaries, wages, and service conditions of the administrative, professional, technical, and clerical staffs employed by local authorities, and to consider such proposals in reference to these matters as are submitted to it from time to time by the provincial councils." The council provides machinery for the regular consideration of these matters and takes steps to secure the recognition of wage agreements by employers and staffs. It also settles any differences that may be referred to it from a provincial council.

The functions of the provincial councils are "to consider any matters that may be referred to them by the National Council and to take executive action in connexion with decisions arrived at and matters deputed to them by the National Council; to make recommendations to the National Council; to consider salaries, hours, and other conditions of service; to consider differences between parties and sections of the service with a view to settlement, and in the event of any difference not being settled, to refer the matter to the National Council for decision." In practice, the settlement of wages and working conditions is, in general, left to the provincial councils, and the National Council intervenes and makes recommendations only when matters are referred to it by a provincial council or when the question is a national one.

A similar National Joint Council was formed for Scotland in 1937.

APPENDIX

(A) FUNCTIONS OF A JOINT INDUSTRIAL COUNCIL

1. To secure the largest possible measure of joint action between employers and workpeople for the development of the industry as a part of national life and for the improvement of conditions of all engaged in that industry. It will be open to the Council to take any action that falls within the scope of this general definition. Among its more specific objects will be the following:

Note.—No hard-and-fast policy is suggested as to what should constitute the function of an industrial council. This is a question which the employers and workpeople in each industry must settle for themselves.

2. Regular consideration of wages, hours, and working conditions in the industry as a whole.
3. Consideration of measures for regularizing production and employment.
4. Consideration of the existing machinery for the settlement of differences between different parties and sections in the industry, and the establishment of machinery for this purpose where it does not already exist, with the object of securing the speedy settlement of difficulties.
5. The collection of statistics and information on matters appertaining to the industry.
6. The encouragement of the study of processes and design and of research, with a view to perfecting the products of the industry.
7. The provision of facilities for the full consideration and utilization of inventions and any improvement in machinery or method, and for the adequate safeguarding of the rights of the designers of such improvements, and to secure that such improvements in method or invention shall give to each party an equitable share of the benefits financially or otherwise arising therefrom.
8. Inquiries into special problems of the industry, including the comparative study of the organization and methods of the industry in this and other countries, and where desirable the publication of reports.
9. The improvement of the health conditions obtaining in industry, and the provision of special treatment where necessary for workers in the industry.
10. The supervision of entry into, and training for, the industry, and co-operation with the educational authorities in arranging education in all its branches for the industry.
11. The issue to the Press of authoritative statements upon matters affecting the industry of general interest to the community.
12. Representation of the needs and opinions of the industry to the Government, Government Departments, and other authorities.
13. The consideration of any other matters that may be referred to it by the Government or any Government Department.
14. The consideration of the proposals for district councils and works committees put forward in the Whitley Report, having regard in each case to any such organizations as may already be in existence.

NOTE.—The following have also been included among the functions in some of the provisional constitutions which have been brought to the notice of the Ministry of Labour: (i) The consideration of measures for securing the inclusion of all employers and workpeople in their respective associations. (ii) The arrangement of lectures and the holding of conferences on subjects of general interest to the industry. (iii) Co-operation with the joint industrial councils for other industries to deal with problems of common interest.

(B) THE CONSTITUTION OF A JOINT INDUSTRIAL COUNCIL

1. *Membership*

The council shall consist of members, appointed as to one half by associations of employers and as to the other half by trade unions.

Associations of Employers	No. of Representatives
(1)	
(2)	
(3)	
etc.	
Total	

Trade Unions	
(1)	
(2)	
(3)	
etc.	
Total	

2. *Reappointment*

The representatives of the said associations and unions shall retire annually, and shall be eligible for reappointment by their respective associations and unions. Casual vacancies should be filled by the association concerned, which shall appoint a member to sit until the end of the current year.

3. *Committees*

The council may delegate special powers to any committee it appoints. The council shall appoint an executive committee and may appoint such other standing or sectional committee as may be necessary. It shall also have the power to appoint other committees for special purposes. The reports of all committees shall be submitted to the council for confirmation, except where special powers have been delegated to a committee.

4. *Co-opted Members*

The council shall have the power of appointing on committees or allowing committees to co-opt such persons of special knowledge not being members of the council as may serve the special purposes of the council, provided that so far as the executive committee is concerned: (*a*) the two sides of the council shall be equally represented, and (*b*) any appointed or co-opted members shall serve only in a consultative capacity.

N.B.—It is desirable to take power to appoint representatives of scientific, technical, and commercial associations upon committees and subcommittees of the council, and the above clause would give this power.

5. *Officers*

The officers shall consist of a chairman or chairmen, a vice-chairman, a treasurer, and a secretary or secretaries.

1. The Chairmen.—The Whitley Report suggests that the appointment of a chairman or chairmen should be left to the council, who may decide that there should be: (i) a chairman for each side of the council; (ii) a chairman and vice-chairman selected from the members of the council (one from each side of the council); (iii) a chairman chosen by the council from independent persons outside the industry; or (iv) a chairman nominated by such persons or authority as the council may determine, or failing agreement by the Government.

2. The Secretary.—The council shall be empowered to maintain a secretary or secretaries and such clerical staff as it may think fit. All honorary officers shall be elected by the council for a term of one year.

6. *Meetings of the Council*

The ordinary meetings of the council shall be held as often as necessary and not less than once a quarter. The meeting in the month of   shall be the annual meeting. A special meeting of the council shall be called within   days of the receipt of a requisition from any of the constituent associations or from the executive committee. The matters to be discussed at such meetings shall be stated upon the notice summoning the meeting.

7. *Voting*

The voting both in council and in committees shall be by show of hands or otherwise as the council may determine. No resolution shall be regarded as carried unless it has been approved by a majority of the members present on each side of the council.

8. *Quorum*

The quorum shall be   members on each side of the council.

9. *Finance*

The expenses of the council shall be met by the associations and trade unions represented.

Correspondence

Medical Demobilization

SIR,—Capt. P. T. Davies (Dec. 23, p. 173) has put forward the point of view of the younger practitioner. I wish to put forward the opposite and equally selfish viewpoint. We who have lost our younger partners welcome the possibility of their return at the earliest possible date consistent with the needs of circumstances. I should like to remind him that many of us are doing the work of two men with the addition of evacuees and Civil Defence duties, that this state of affairs has been going on for two, three, four, or more years, and that most of us are wondering how much longer we can manage to keep it up. Let me also remind him that the majority of these partners are married men with families, who last saw their wives and their children on their embarkation leave if they were posted abroad.

One further point that Capt. Davies may not realize is that it is virtually impossible to replace any civilian practitioner who leaves his practice, whether from illness or death or any other cause, and that those who have died have, in nearly every case, given their lives in the service of their country as surely as the valiant young men lost in the Services.—I am, etc.,

Fleet, Hants. T. C. JAMESON EVANS.

SIR,—The eventual prospect of release from the armed Forces probably bulks too large nowadays in the minds of those of us whose service is extending up to and beyond the five-year mark. Our anxiety and preoccupation will not be diminished, however, by news from home of incidents such as the following:

A death vacancy recently occurred in a remote country practice: apparently no sufficiently active locumtenent could be found, and the civilian organization concerned demanded the release of a specific Service M.O. to fill the vacancy. This fortunate young man had no particular qualification except that, shortly before his call-up, he had negotiated with the late practitioner for a post-war purchase of the practice. He had served for one year in the Army, and his oversea tour comprised four months on L. of C. duties in N.W. Europe. The military authorities, actuated, let us hope, by a stronger sense of fair play, refused his release.

Most of us out here have heard of similar cases. There are many of us now in the thirties, with families approaching school age, who have gradually lost all touch with civilian practice and those in whose power the disposal lies. Not only is there the possibility of those vacancies that must be filled before the war ends going to those who have most recently left civil life: a much more depressing expectation lies beyond that. Actuated by both fresh memories of personal friendship and the desire to preserve the *status quo* in the present uncertain state of civil practice, there is bound to be strong pressure by influential and established individuals within or without the profession to secure the priority release of those with civil practices of their own when the end of the European war at last permits the return of a quota of serving M.O.s.

Surely the release of doctors, as of other sections of the community, should be governed by age and length of service. Any claim that the possession of a civil practice is a title to priority release as a key individual (Class B of the Army scheme) is tantamount to an assumption that those due for release in Class A cannot be trusted (even under the safeguards usually enforced) to run those practices as locumtenents until their owners are in turn due for release. Many recent letters in the *Journal* have contained the phrase, "We owe it to our colleagues serving over-seas. . . ." I think most of us would consider that debt (if any) well paid if we could have a specific and authoritative assurance on this point. Or must we resign ourselves to yet one more repetition of "To him that hath shall be given, but from him that hath not . . ." A chilly philosophy at the best of times, and by now altogether too cold to comfort those of us at the wrong end of the bargain.—I am, etc.,

P. DELAP,
C.M.F. Capt., R.A.M.C

Mental Hospital Doctors' Pay

SIR,—This is my position as second assistant medical officer after 14 years' service as such. Salary, £600, rising by £25 yearly to £700 (no emoluments). Up to now I have been charged £130 per annum for apartments, etc. Recently I have been granted a war bonus of £49 8s., but the amount charged for apartments has been raised to £150. (After paying this increased charge, income tax, and superannuation, the bonus is worth exactly £3 3s. a year.) After all deductions my cash payment amounts to £292 7s. 6d.

Compare the matron's position: on maximum service, £500 cash, emoluments valued at £150. The deduction is income tax on £500 only, leaving a cash payment of £343 7s. 6d. The third assistant medical officer would receive about £120 less than the second assistant medical officer and about half the amount the matron gets. Before the adoption of the Rushcliffe report scale the head male nurse was paid £330 per annum; now he gets £550, an increase of about 66%, antedated, of course, to April, 1943.

Considering the respective qualifications and the expense and study in acquiring these, it is very obvious that the salaries are out of all proportion. The time is surely ripe for substantial increases in the salaries of assistant medical officers in mental hospitals.

It is unlikely that visiting committees will make proper increases unless strong influence is brought to bear by the B.M.A. as indicated by "M.R.C.S." in the *Supplement* of Dec. 30 (p. 179).—I am, etc.,

P. Q. R.

Salaries of Health Department Civil Servants

SIR,—On looking through *Whitaker* recently I was surprised to find that in all Government Departments dealing with health, with the solitary exception of one in Scotland, the highest-salaried appointments are given to lay civil servants. If the medical profession is to be "shanghaied" into (or should it be "under") the Civil Service there will naturally be a considerable increase in such highly paid posts made available for lay civil servants, and it is as well to bear in mind that the salaries attached to such posts will presumably continue to bear the same relation to those allotted to the main body of medical men whose work is much more arduous and responsible. Also, it is highly probable that such "honours" as are distributed will continue to go mainly to the lay officials.—I am, etc.,

Totnes. B. H. SHAW.

Heatlh Centres and General Practice

SIR,—I was very interested to read Dr. A. Garvie's study on the incidence of colds and influenza in general practice (*Supplement*, Jan. 6, p. 1). I was pleased to see that medical research is carried out in general practice, but I am afraid I cannot agree with the conclusions. I have discussed this problem of treatment for colds with hundreds of people, and the majority of workers do not consult their doctors because it is easier for them to get medicinal treatment from the well-advertised wares in the chemist's shop without a considerable amount of waiting and inconvenience. I admit distance from the surgery is probably a factor, but the impression I gained is that the distance from the ubiquitous chemist's shop was a much more important factor, and if this was taken into consideration the conclusions that Dr. Garvie came to may have been completely different.

It may well be that when we have efficiently run health centres linked with proper and adequate pharmaceutical establishments the worker may certainly prefer attending his doctor rather than accepting something for which he has to pay over the counter, especially as the alternative will no longer be a long wait and an overcrowded waiting-room and a busy, overworked doctor. In the health centres, with clerical assistance, the doctors will, I am sure, have a better appreciation and realization of cold and 'flu epidemics and be in a better position to prevent them.—I am, etc.,

Princes Risborough. S. LEFF.

Towards Agreement

SIR,—Dr. Selby does well to remind us in his letter (Dec. 30, p. 179) of the dangers of coming to any agreement with the Government. However, to those of us who are convinced that State medicine is the ideal for the community, including the medical profession, loyal co-operation with the Government to produce the *ideal* scheme is the only course open.

Two conditions are essential to an ideal scheme—namely, that remuneration and service should be adequate and just to both parties to the agreement, and that each party should be safeguarded against lack of integrity in the other.

As in the last resort public respect and support will provide our greatest safeguard, stubborn opposition to any progress should find no place in our policy.—I am, etc.,

Stroud. HERMAN MOULD.

H.M. Forces Appointments

ARMY

Col. (Temp. Major-Gen.) S. W. Kyle, late R.A.M.C., Reserve of Officers, has relinquished the temporary rank of Major-Gen. on ceasing to be employed.

REGULAR ARMY RESERVE OF OFFICERS

Col. S. W. Kyle, late R.A.M.C., having exceeded the age limit of liability to recall, has ceased to belong to the Reserve of Officers and has been granted the honorary rank of Major-Gen.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Major B. Day has resigned his commission and has been granted the honorary rank of Lieut.-Col.

War Subs. Capts. C. C. Brewis and A. C. Barker have relinquished their commissions on account of disability, and have been granted the honorary rank of Major.

War Subs. Capt. D. Rumney has relinquished his commission, and has been granted the honorary rank of Capt.

War Subs. Capts. M. A. Stanton and I. R. I. MacDonald have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

Lieut. L. G. Leitch has relinquished his commission on account of disability, and has been granted the honorary rank of Lieut.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

War Subs. Capt. (Mrs.) M. H. Bunney has resigned her commission.

War Subs. Capts. (Mrs.) L. M. M. Lake and (Miss) N. M. Morrison have relinquished their commissions.

Lieut. (Mrs.) A. N. M. Crane has relinquished her commission.

The following M.O.s have been granted commissions in the rank of Lieut.: Sarah I. Cochrane, Winifred M. Curgenven-Robinson, Mary D. Dixon, Phyllis Eskell, Barbara J. Hussey, Mary P. Karney, Kathleen M. Knox, Flora Macaulay, Patricia E. Mitchell, Eleanor R. Raistrick, and Joan E. Spicer.

ROYAL AIR FORCE

Wing Cmdrs. F. L. White, C. G. J. Nicolls, and A. F. Cook to be Gp. Capts. (Temp.).

Squad. Ldrs. R. F. Wynroe, L. N. Trethowan, A. S. Amsden, H. D. Conway, J. R. R. Jenkins, G. B. MacGibbon, D. J. Dawson, J. R. Cellars, D. F. S. Shaw, J. H. Neal, R. H. Pratt, C. C. Barker, A.F.C., J. C. Taylor, W. T. Buckle, and E. S. Sidey to be Wing Cmdrs. (Temp.).

RESERVE OF AIR FORCE OFFICERS

Squad. Ldrs. R. G. James, P. A. Lee, E. Corner, H. S. Barber, H. F. Harvey, W. G. S. Roberts, D. W. I. Thomas, and E. W. R. Fairley to be Wing Cmdrs. (Temp.).

AUXILIARY AIR FORCE

Squad. Ldrs. W. D. Peock and N. R. Smith to be Wing Cmdrs. (Temp.).

AUXILIARY AIR FORCE RESERVE OF OFFICERS

Squad. Ldr. A. C. Fraser to be Wing Cmdr. (Temp.).

ROYAL AIR FORCE VOLUNTEER RESERVE

Squad. Ldrs. J. G. Milner, J. H. Doggart, A. C. P. Campbell, K. A. Latter, A. W. Badenoch, G. A. Jamieson, G. M. Rose, D F. E. Nash, H. B. Bagshaw, J. A. Pocock, A. G. Wilson, J. F. Bromley, A. Ronald, G. H. Bateman, J. G. L. Brown, H. A. Graham, and J. Howkins to be Wing Cmdrs. (Temp.).

Fl. Lieuts. L. O'N. Knox, H. A. Thomas, J. G. Bate, T. V. Mendlesohn, J. T. Burrowes, W. M. R. Henderson, J. G. Molony, D. C. Moore, N. McSharry, J. S. A. Linton, R. F. H. McElligott, A. O'Connor, W. P. D. Logan, B. E. Finch, C. Joseph, A. M. Goldthorpe, L. H. Buckland, J. O'Leary, W. H. Peck, F. S. Rae, W. Selbie, J. D. Thomson, M. Walton, C. E. Astley, R. O. Gillespy, P R. B. Grimaldi, K. N. Lloyd, A. M. Phillips, P. Murphy, D. S. Pattison, R. D. Henderson, W. E. Bryan, R. McP. Cross, D. O. Dickie, G. Fraser, A. G. Riddell, G. A. Strain, P. A. Tyser, I. D. Grant, T. H. Cullen, M.B.E., W. D. Doey, B. J. Frankenberg, G. N. L. Godber, J. H. Hurt, and J. W. Paulley to be Squad. Ldrs. (Temp.).

Fl. Lieut. (Temp. Squad. Ldr.) J. S. Davies has relinquished his commission on appointment to the R.C.A.F.

Fl. Lieuts. W. E. Rigby and N. K. Farley have relinquished their commissions on account of ill-health.

D. S. Lewes to be Fl. Lieut. (Emergency).

To be Flying Officers (Emergency): M. J. Collins, G. J. Flynn, S. W. N. Gibson, C. I. Kelly, J. D. Morrissey, and J. R. Ryan.

WOMEN'S FORCES

EMPLOYED WITH THE MEDICAL BRANCH OF THE R.A.F.

Fl. Lieuts. G. E. N Meyer and M. Calvert to be Squad. Ldrs. (Temp.).

INDIAN MEDICAL SERVICE

Col. J. P. Huban, O.B.E., to be Major-Gen.

Lieut.-Cols. R. A. Logan, O.B.E., and E. Cotter, C.I.E., to be Cols..

Lieut.-Col. J. H. Barrett has retired on account of ill-health.

Major W. J. Shipsey to be Lieut.-Col.

Capts. D. J. P. Parker, F. J. O'Dowd, and T. C. M. M. Morrison to be Majors.

Capt. (Mrs.) G. O. W. Millington has resigned her commission.

EMERGENCY COMMISSIONS

Capt. A. E. Stevens to be Major.

EMERGENCY HOSPITAL SCHEME

The following amendments have been made to the list of orthopaedic centres, fracture departments, and fracture clinics:

Region II, *Fracture Departments A:* Royal Infirmary, Bradford; St. Luke's Municipal General Hospital, Bradford; General Infirmary at Leeds; Royal Sheffield Infirmary and Hospital; The Royal Infirmary; Westwood Emergency Hospital, Bradford.

Region III, *Fracture Departments A:* County General Hospital, Worksop. *Additional Fracture Clinics C:* Worksop and District Cripples Guild Worksop.

Region VII, *Fracture Departments A:* Mount Gold Hospital, Plymouth. *Fracture Departments B:* Taunton and Somerset Hospital, Taunton.

Region VIII, *Fracture Departments A:* Caerphilly District Miners' Hospital, Caerphilly.

Region IX, *Fracture Departments A:* Royal Hospital, Wolverhampton; Birmingham Accident Hospital and Rehabilitation Centre.

Region X, *Fracture Departments A:* Royal Infirmary, Manchester; Withington Hospital, West Didsbury, Manchester; Salford Royal Hospital, *Fracture Departments B:* Eccles and Patricroft Hospital, Patricroft; Chorley and District Hospital, Chorley.

London Sectors, Sector 6, *Additional Fracture Clinics C:* British Red Cross Society Clinic, 7A, Queen Victoria Road, High Wycombe, Bucks. Sector 8, *Additional Fracture Clinics C:* British Red Cross Society Orthopaedic and Rheumatic Clinic, St. Anne's Hall, Bagshot, Surrey.

POSTGRADUATE NEWS

Clinical meetings are being arranged weekly at St. Stephen's Hospital, Fulham Road, Chelsea, S.W., on Fridays at 2.30 p.m., at which all medical practitioners are welcome.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—*Tues.*, 3 p.m., Lloyd-Roberts Lecture by Mr. Desmond MacCarthy: Psychology in Literature.

ROYAL SOCIETY OF MEDICINE.—*Thurs.*, 2.30 p.m., Section of Neurology. *Fri.*, 10.30 a.m., Section of Otology; 2.30 p.m., Section of Anaesthetics; 2.30 p.m., Section of Laryngology.

BIOCHEMICAL SOCIETY.—At British Postgraduate Medical School, Ducane Road, W., *Sat.* (Feb. 3), 11 a.m.

ROYAL INSTITUTION, 21, Albemarle Street, W.—*Tues.*, 5.15 p.m., Mr. T. Wallace: Visible Symptoms Produced by Mineral Deficiencies.

B.M.A.: Branch and Division Meetings to be Held

NORTHERN IRELAND BRANCH.—Joint meeting with Ulster Medical Society at Whitla Medical Institute, College Square North, Thurs., Feb. 1, 8.15 p.m Meeting. Address by Mr. C. H. G. Macafee: Placenta Praevia.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTHS

DUFF.—On Jan. 8, 1945, at Salisbury, to Lydia M Duff, F.R.C.S.Ed. (*née* Grey) and Alexander Duff, F.R.C.S.Ed., a son.

HOOD.—On Jan. 6, 1945, at St. Brenda's Nursing Home, Clifton Park, Bristol, to Barbara (*née* Boyle), wife of Surg. Lieut.-Cmdr. M. C. Hood R.N.V.R., a daughter.

JACOBS.—On Jan. 11, 1945, at Hammersmith Hospital, W.12, to Lusia, wife of Alan L. Jacobs M.R.C.P., a daughter.

KELLY.—On Jan. 8, 1945, at the "Lindo Wing," St. Mary's Hospital, Paddington, W.1, to Peggy (*née* Stone), wife of Surg. Lieut. Reginald E Kelly, R.N.V.R., a daughter—Angela Margaret

MILLINGTON.—On Jan. 15, 1945, at the Maternity Hospital, Liverpool, to Olga (*née* Watson), M.B. Ch.B., wife of Surg. Lieut. Gordon Millington R.N.V.R., a daughter.

DEATH

MEREDITH.—On Jan. 16, 1945, in a Bournemouth nursing home, peacefully after a short illness R. W. H. Meredith, M.R.C.S., L.R.C.P. (ret.) aged 69 years 11 months, dearly loved husband of Lilian Meredith.

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY FEBRUARY 3 1945

CONFERENCE OF RADIOLOGISTS

A Conference of Radiologists arranged jointly by the B.M.A., the Faculty of Radiologists, and the British Institute of Radiology was held at B.M.A. House, Tavistock Square, London, W.C.1, on Saturday, Jan 20, to consider matters affecting the practice of radiology arising from the Government White Paper on a National Health Service. Dr. S. Cochrane Shanks was appointed chairman, and among the 43 radiologists present were Dr. Ralston Paterson, President of the Faculty of Radiologists, and Dr. Rohan Williams, President of the British Institute of Radiology.

RADIODIAGNOSTIC SERVICES

The Conference considered a recommendation by the Faculty that all radiodiagnostic work within the comprehensive health service should be under the direct supervision of a consultant radiologist. Dr. H. S. Howie Wood referred to the position of those practitioners who, although not engaged exclusively in consultant work and possessing no diploma in radiology, fulfilled a definite function as radiologists. He said the tendency was towards the extinction of this class of part-time specialists. The conference should recognize the status of "graded" or assistant radiologist, as the Central Medical War Committee had done. The words "provision being made for the utilization of the services of part-time radiologists" should be added to the resolution. Dr. P. C. Bhandari, speaking as one who, while in charge of a hospital radiological department in a town of 20,000 population and assistant radiologist at four or five other hospitals in the London area, was also engaged in general practice, thought that there were many practitioners doing this kind of combined work and doing it efficiently. A place should be found for them in the new scheme. Dr. R. Fawcitt, on the other hand, said that he had been in mixed general and radiological practice for a period, and in his opinion both jobs could not be done properly, while Dr. G. Q. Chance pointed out that because certain people had done both jobs well it did not follow that the principle was right.

Dr. Rohan Williams asked whether it was to be inferred that the term "consultant radiologist" related to a registered medical practitioner possessing a radiological diploma. After some discussion on this point the resolution was finally approved in the following terms:

> That all radiodiagnostic work should be under the direct supervision of a consultant radiologist who satisfies defined criteria of specialist status.

The Open or Closed X-ray Department

There was a lengthy discussion of the question whether the *x*-ray department should accept patients directly referred to it from sources outside the hospital, or whether all cases for *x*-ray examination under the new service should be referred through one or other of the clinical departments of the hospital.

Dr. Whately Davidson favoured the closed department; in his view a big responsibility would be placed on the radiologist if he were left to decide whether or not a particular radiological examination should be carried out in the wide range of cases that would be dealt with under the new service. Dr. G. F. Stebbing said that in a scheme which claimed to provide the best possible service for the patient the sparsely populated areas were entitled to the same facilities as the towns. If the new service was to be efficient it must be made available equally to patients in all types of area.

Attention was drawn to a recommendation of the British Institute of Radiology that the scheme should not preclude radiological investigation and treatment of private patients by the radiologist in any institution forming part of, or co-operating with, the comprehensive medical service. Dr. M. H. Jupe thought that the question of private patients should not be introduced at the present stage. Under a service which was really comprehensive, both general practitioners and patients would demand radiological services without formality or reservation. If the "closed department" idea were persisted in there would be a tendency to demand *x*-ray apparatus for health centres and to set up units in small centres staffed largely by general practitioners and radiographers. If direct access meant that there would be extra demands on *x*-ray departments the comprehensive service should ensure the increases in accommodation, equipment, and staff necessary to meet those demands. Dr. F. H. Kemp, supporting Dr. Jupe, urged the establishment of the principle that radiologists should have a status equal to that of any other member of the medical staff of a hospital or health centre, and should have the same right of approach by patients or doctors.

Dr. J. Blair Hartley said the problem had to be considered from the individual viewpoints of the teaching and the non-teaching hospitals. He would be inclined to support the closed department for the teaching hospital, but there was no method yet devised whereby an *x*-ray department could be "closed" effectively in the smaller non-teaching hospitals. The out-patient department was often in the charge of a part-time specialist who was also a general practitioner, and who could not reasonably be burdened with the responsibility of deciding whether or not a case sent to him by one of his general-practitioner colleagues should be referred to the *x*-ray department. Prof. B. W. Windeyer thought that from the teaching point of view the physicians in charge of out-patient departments would probably not be in favour of all patients referred from outside for radiological investigation undergoing a preliminary clinical examination in the out-patient department. There were other dangers in the closed department. It would be difficult to insist that patients referred by a general practitioner under the comprehensive health service should undergo a preliminary medical examination, sometimes by a relatively junior member of the hospital staff, and at the same time allow direct access to the radiological department for patients referred privately.

The Conference passed three resolutions on this subject:

> (1) That consultant radiologists should be regarded as full consultants with status and remuneration no less than those of other recognized consultants.
>
> (2) That while recognizing that there may be need for special arrangements in teaching hospitals, the normal arrangements of the comprehensive health service should ensure that all patients shown to be in need of radiological service receive it.
>
> (3) The scheme shall not preclude radiological investigation and treatment of private patients by the radiologist in institutions forming part of or co-operating with the comprehensive medical service.

Health Centres

The discussion on the provision of radiodiagnostic services was completed by two resolutions on facilities at health centres:

> (1) That if health centres are to be of the communal surgery type (the type contemplated in the White Paper) it is contrary to the public interest that radiological facilities should be available at such centres.
>
> (2) That if health centres are to be of the consultative type—diagnostic centres for special investigation—the specialist services available should include radiological facilities under the control of a consultant radiologist.

RADIOTHERAPY SERVICES

Dr. Ralston Paterson urged that in the interests of the patient, especially in connexion with the treatment of cancer, large centres were essential for first-class radiotherapy. On his proposal the following resolution was adopted:

> That radiotherapy should only be conducted by consultant radiotherapists. It should mostly be concentrated in large centres, which must be adequately equipped and linked with a university centre or other key hospital in the area.

REMUNERATION

On the subject of payment the Conference expressed the following opinions:

> (1) That the scales of remuneration for consultants and specialists, including consultant radiologists, should be negotiated centrally.
>
> (2) That in so far as the Government's proposals for salaried remuneration on a part-time basis contemplate the continuation of private practice in radiology, as in other specialties, it should be recognized that the potential income from private practice of the radiologist will be less than that of other specialists, and the part-time salaries of radiologists generally should be a higher proportion of the whole-time salary.

Concerning the range of remuneration the Conference was reminded that the Goodenough Committee had made recommendations for teaching staffs and that the Minister of Health was about to appoint a committee of inquiry on the range appropriate to general practitioners. It was decided to defer detailed consideration of these questions until the report of this committee was available.

OTHER MATTERS

The Conference approved a resolution of the Medical Committee of the British Institute of Radiology that consultant radiologists should be represented on the Central Health Services Council. A number of other matters were referred to the Radiologists Group Committee of the B.M.A. These included: (1) The criteria for specialist status; (2) a resolution that the possibility should be explored of arranging regional conferences of radiologists to discuss matters arising out of the discussions that are taking place with the Ministry on the organization of a National Health Service; and (3) the question of maintaining a closer liaison with radiologists in the Services, especially those serving over-seas, and of obtaining their views on important issues.

The meeting concluded with votes of thanks to the chairman, and to the secretariat of the B.M.A.

Correspondence

The Ministry of Health and Radiology

SIR,—Your correspondent Dr. M. Wigfield (*Supplement*, Jan. 6, p. 4) appears to be a man with a grievance, based on ignorance. Several points arise.

1. The Ministry of Health appoints a selection committee—mainly medical—to interview candidates and select those most suitable for specialist training as radiologists.

2. The candidates are required to take, *at their own expense*, the University of London course for the diplomas in radiology.

3. At the end of the course the candidates are required to take a diploma in radiology. The only ones available at present are the conjoint diploma in medical radiology (diagnostic and/or therapy) and the University of London academic diploma in medical radiology. Others may exist in the Provinces, but the Ministry has no connexion with course or diplomas, and pays for neither. Indeed, last year one candidate fell out for financial reasons.

4. The successful candidates are engaged as radiological junior medical officers to perform routine (radiological) duties in hospitals to which they are appointed (usually in accordance with their own wishes in the matter, for full choice is given where possible). Appointments are made only after consultation with the Central Medical War Committee.

5. The Faculty of Radiologists has nothing to do with course or diploma, and the British Institute of Radiology plays a part in this question only when asked to do so by the Conjoint Board of Examiners or by the University of London. The standard of examination is the concern of the examiners, not of the Ministry, and the examining body has the final say in such matters (and, in the case of the University, the Senate).

6. This will be the third course instigated by the Ministry during this war. Last year's ran well, and there were few complaints.

7. The Ministry of Health pays those appointed in accordance with standard E.M.S. rates for the work they can do at their hospitals, though time is needed before the inexperienced can start to perform useful work in a specialist capacity. The rates of remuneration are generous—as the majority of candidates agree; during the first course under this scheme, in fact, there was considerable ill feeling on the part of hospital house officers working at voluntary hospital rates.

8. At the conclusion of the course the successful diploma candidates continue to be employed, at the same rate of salary, until they are given the chance of accepting an appointment in a hospital where there is need for a radiologist. There is a "gentleman's agreement" to the effect that they should serve the E.M.S. for a further year after obtaining the diploma. There is no question of possession of "body and soul." Throughout (even those who fail the diploma are given another chance) the candidates are treated fairly, even though at times the wheels of authority do grind exceeding slow. It is supposed unofficially that the intention is to supplement services where they are most lacking. The duration of the E.M.S. is of no import at present so long as radiological or other services are available where needed by the medical profession in connexion with diagnosis and treatment of disease.

No, Sir, your correspondent's grievance is wrongly directed. One would rather expect him to be envious of the medical man, who is paid to become a specialist, and whose treatment by the Ministry is such that at the end of his training he remains in the employment of the Ministry, whole-time or part-time, of his own free will. Surely that is adequate testimonial of satisfaction with working conditions, and of the efficient, if slow, execution of the recommendations to the Ministry of their medical advisers.—I am, etc.,

"A.D.M.R."

The White Paper Proposals and Local Option

SIR,—The impression left upon me by the discussions at the A.R.M. is that on many of the questions at issue the meeting was reluctant to commit itself to definite decisions likely to tie the hands of our Negotiating Committee when at grips with the Ministry. On two matters, however, the R.B. was emphatic: (1) quite unanimously, that unless the administrative proposals were radically altered no agreement on the general proposals in the White Paper are possible; and (2) not so unanimously, that a whole-time salaried service is not acceptable to the profession.

On the first the whole profession is, and must remain, adamant, since with the administrative arrangements is bound up that freedom from clinical control which is the most vital issue of the controversy, whatever the system of service ultimately decided. On the second question, however, the profession is not so unanimous; yet, if any attempt by the Ministry to impose a whole-time salaried service on an unwilling majority is made that majority is justified in resisting to the uttermost. But if such resistance to the dictation of a lay body is justified for the majority, is that majority also justified in refusing to a not inconsiderable minority the right to choose the service it prefers?

Some Divisions have pronounced in favour of a salaried service. I can name at least three which are of considerable importance. Moreover, the results of the Questionary are significant. Over one-quarter of the Service members are in favour, and, in addition, as shown by another Questionary, one-third of the medical students, in due course to become members of the profession, have voted in favour of a salaried service. Is it safe, therefore, to say that round about 25% of the profession now or in the future are in favour of a whole-time service? I have already suggested that it would not be just to refuse these men and women the service they desire, but would it also be wise? Is such an attitude likely to lead to that unity of our front which should be preserved at all costs in face of the common adversary? Can we forget what happened in 1911, when, like Byron's young lady, we, "vowing we would ne'er consent, consented."

These considerations embolden me to put forward a proposal, in my mind for some time past, and briefly mentioned in my letters of Sept. 16 and Oct. 14, 1944—namely, that arrangements should be made whereby Divisions, parts of Divisions, or Health Centres should have the opportunity of deciding for themselves what kind of service they desire. Call it a system of local option if you like.

The right to choose should be given in the first place to Divisions. But some Divisions are too large, or too heterogeneous, for such a choice fairly to be made. I instance the two with which I am best acquainted: Chesterfield and Derby. Chesterfield is centred round the town of that name. It comprises urban practitioners in the town itself, partly industrial and partly residential, and a large number of rural or semi-rural practitioners scattered over a district of about fifteen miles' radius from the centre. Many of these doctors are single-handed, some very isolated, but nearly all practically whole-time contract practitioners, since in the mining area the miners' dependants are covered by a contract system for medical attendance. Hence, probably, the predilection of this Division for a whole-time service, since such would be, in effect, the result of the White Paper proposals. Derby is an even more striking example of a heterogeneous Division, comprising as it does the urban practitioners of Derby itself, who dominate its decisions, and almost one-half of the rural parts of the county, with many single-handed practitioners, some of them completely isolated from their colleagues. In areas like these the whole Division is hardly suitable for an option and should be split up into subdivisions for this purpose. Particularly should this apply to areas in which Health Centres are established. The staffs of such centres should be given an option as also should groups and even isolated practitioners. If such a system were established it would, in large measure meet the views of those of the Service members who desire a whole-time service; they would naturally choose whole time areas for settlement on their return

Is it administratively possible? The Ministry itself apparently sees no difficulty, since a salaried service is one of the methods proposed by it. Moreover at the urgent request of the West Highlands it has been decided to allow whole time salaried service in these areas—a striking example of local option in being

Would it lead to a universal whole time service? In comparison with the effects of the general proposals of the White Paper the influence of local option would be almost negligible. On the other hand, it might well be that, by satisfying the aspirations of a minority and thereby retaining its loyalty to the B.M.A., local option might actually have a retarding rather than an accelerating influence. At the same time, the preference of the majority for an independent type of practice would be fully met over the greater part of the country.

I venture to submit the above for the consideration of my colleagues, believing, as I do, that it is in the interest of unity, of justice, and of wise and far-seeing policy that some such compromise should be arranged.—I am, etc.,

Ashover. H. W. POOLER.

The Prime Minister's Free Choice

SIR,—I was interested in the report of the Scottish Clerks Association's annual meeting quoted in their journal for December, in which Sir Wm. Marshall, chairman of the Federation Committees of the English, Scottish, and Welsh Associations of Insurance Committees, made the following statement: "I am heartily in favour of the extension of medical treatment, but I do not want to find that treatment secured in a way that will not give the best results. I am a believer in the right of the individual to choose his own doctor, to choose his own treatment, to decide for himself where he is going. I do not want to submit myself to a Government official's decision on these matters. And let me point this out to you: our great Prime Minister to-day is a believer in choosing his own medical attendant. He is very fond of long journeys, undertaken in the interests of the State and to the great advantage of the State. Wherever he goes there are doctors, hospitals, specialists, and consultants, but Mr. Churchill takes his own doctor with him; he makes sure he has his own adviser with him. Lord Moran goes with him to North Africa, to the U.S.A., to Persia, to Normandy, because Mr. Churchill knows the value of free choice of doctor. What is good enough for the Prime Minister is good enough for me."

I had not heard this happy allusion mentioned at any meeting or conference, and I think it deserves a wider recognition.—I am, etc.,

WM. PARKER.
Chairman, Swansea Medical and Panel Committee.

The L.C.C. and the N.H.S. Proposals

SIR,—The Representative Body and the medical profession in general have declared their special and uncompromising hostility to the proposals in the White Paper which would place doctors and hospitals, including voluntary hospitals, so largely if not predominantly under the control of local authorities in each area. How profoundly justified this reaction actually is may be, I think, best gauged by the programme for the future role of local authorities as sketched by the London County Council in certain recommendations recently published which have been passed by the Council and submitted to the Minister of Health. The L.C.C. is by far the largest local authority in this country, with something like 100 separate hospitals under its direction. The example of this body will inevitably set the pace for the other local authorities throughout the country, and an examination of the claims made by the L.C.C. is of paramount importance to our profession. I abstract the principal recommendations hereunder.

They start off with the claim that the London County Council "shall be constituted *by statute* (the italics are mine) the authority for planning, controlling, and administering the proposed comprehensive medical practice, including all such functions which form part of it, throughout the administrative County of London," except for some minor functions which the L.C.C. is good enough to delegate to the metropolitan borough councils.

The Council further claims that it should have "adequate representation on the central and local advisory, executive, and technical committees" which may be appointed as a medium of negotiation between the doctors and the Minister of Health, but there is no reciprocal right for "professional and other bodies to membership of the appropriate committee of the Council charged with the administration of the scheme." It further claims the right to be "a party to any negotiations between the Minister of Health and the voluntary hospitals and doctors on matters which are likely, directly or indirectly, to cause financial obligations on the Council." As there are very few matters upon which such obligations will not be created, the claim seems to demand that the Ministry must admit L.C.C. representatives to all discussions with the profession. Further, the Council expresses its desire "to have the scheme ready before demobilization occurs."

All impartial observers are convinced that the White Paper proposals, as they stand, must result in the more or less speedy absorption of all the voluntary hospitals into the public hospitals scheme. There are 21 voluntary teaching hospitals in England and Wales, 13 of which are in London; all thirteen are schools of London University, which is thus responsible for the training of more than half of all the medical students south of the Tweed. The voluntary hospitals again have been and are the principal centres of medical research. The injury to medical education and to medical research which would follow the entrusting of these activities to be "planned, controlled, and administered by" the local authority in each area would indeed be irreparable.—I am, etc.,

House of Commons. E. GRAHAM-LITTLE.

The Medical Service Subcommittee

SIR,—Mr. Harcourt Kitchin (Dec. 30, p. 175) has done well to draw the attention of practitioners to the terms and conditions of N.H.I., though I find his use of the term "complete protection" and his general eulogy surprising.

It would take too long to discuss details of all aspects, so I go to the heart of only one section—the Medical Service Subcommittee—for, as Mr. Kitchin states, its decision is highly important to the doctor. But I consider that this committee is not one in which a doctor can place confidence, and as his professional reputation may be at stake it should be very much better constituted than at present so as to inspire a feeling of impartiality. The doctor can rightly be suspicious of the laymen, for it is well known how ready they are to be down on him if given a chance; particularly long standing is the contention between approved societies and the profession.

What of his colleagues? Their impartiality is strained because: (*a*) If they are zealous on behalf of the doctor they will be accused of favouring him at the expense of the patient, and they therefore rather tend to go in the opposite direction. (*b*) I believe that for some years before the war the B.M.A. and Panel Committees have tended to discourage any attempts to alter the Regulations, and this has influenced doctors on the Medical Service Subcommittees not to advise stronger action to fight cases. Finally and supremely, a doctor is not allowed active legal representation at the hearing. Doctors generally have neither training nor aptitude for defending themselves. In the circumstances just where legal help is most necessary it is denied. A patient has little responsibility in bringing a complaint; a doctor has much to lose and should have every defence available to him. Where, then, is this so-called complete protection?

For these reasons, therefore, the procedure should be changed. Some have tried for years to get an appeal to the Courts, though this has always been disliked and opposed by the B.M.A. That practitioners are indeed now sceptical of the protection of the N.H.I. Act and realize that a change is necessary is shown by several letters in the *Journal*, and at last even the Panel Conference has passed a resolution in favour of the right of appeal to the courts; though this will still have to be insisted upon if we are to get it.

My opinion is the Medical Service Subcommittees as at present constituted should be abolished and a body established independent of all the interests concerned, such as an arbitration court, which, I think, would be much fairer and give more confidence. At least legal support at the time of hearing must be allowed. I may be accused of prejudice, but if one reads the records in the *Journal* over the course of years and studies *Medical Insurance Practice* by Harris and Sack, one gets an impression of unfair verdicts and a general bias against the doctors. I think (if an appeal is made) that the Minister is fairer and more impartial than the lower committees, and more cases should be sent to appeal.

Why do so few cases come before the committees? Because practitioners and patients are blissfully ignorant of the multitudinous rules and regulations, and go on happily until someone has a grievance. Then the doctor first begins to realize what a tangle there is and how unfavourably he is situated. If more of these cases had been taken to appeal, or there had been an appeal to the courts, "Harris and Sack" might make pleasanter reading. It would perhaps be salutary to commence a new investigation ot the rules, for if the N.H.I. Act is to be extended, we had better know all about it. and then alter it to ensure that it really gives that "complete protection" which Mr. Kitchin praises.—I am, etc.,

London, W.9. S. CROWN.

All Round the Clock

SIR,—While agreeing with Dr. L. I. Hardy (*Supplement*, Jan. 20, p. 10) that the general practitioner (or "family doctor") is always overworked, even to a degree affecting his longevity, I must argue with his suggestion for cure. I submit that a willing readiness to serve his patients "all round the clock" must always be an essential characteristic of the family doctor (there are plenty of professions open to those unwilling to give so much). My own efficiency would be increased by a decreased pressure of work, and I assume the same to be true of my colleagues generally. But decreased pressure of work (and even increased longevity) would be too dearly bought were the price to be any lessening of our willingness to serve those who entrust their care to us. Dr. Hardy's "emergency squads" would be incompatible with a truly independent individual family-doctor service; their coming would only imply more control and government than we have hitherto considered tolerable.

Relief from overwork must come, not by a lessening of our personal responsibility to the individual, but by a lessening of the number of people for whom each one of us cares. The solving of this problem, *which is the basic problem of family doctoring,* depends on: (*a*) an adequate remuneration for each patient, and (*b*) an adequate number of doctors. Each area carries not the number of doctors needed for the work there but the number which the population can afford to support, so that industrial areas generally are under-doctored.

The question of remuneration is an involved one. Should we be paid by our patients or by the State? If the Government is to carry the responsibility should it do so by so guiding the country that each citizen can earn an adequate income or should it be done by doles? Here we are in the frightening country of the politicians. Sir William Beveridge has his opinion and I have mine, but what is the opinion of the profession? These are the basic questions which we should be thrashing out instead of allowing ourselves to be led by the nose into discussions on the structure of a medical service which only the politicians want. Once the question of remuneration is settled the supply of doctors will increase. There will still, however, be difficulties in the way of producing an adequate increase. The problem is delicate, since any attempt merely to bribe people into the profession must lead to a lowering of our standards, and this we must sternly resist. Here is another field for thought and discussion within the profession.

So, while sharing Dr. Hardy's anxiety about overwork, I would urge that we tackle the problem by getting to its roots, and not by such symptomatic treatment as he prescribes.—I am, etc.,

West Bromwich. D. SAKLATVALA.

FROM THE PRESS CUTTINGS

"The truth is that people do not want to be positively healthy. The suggestion exercised by the patent-medicine advertisers falls on receptive ground. People take patent medicines not because they are fatigued, anaemic, nervous, overworked, and suffering from sleeplessness and headaches, but because they like to think they are."—From the *Economist.*

"Isn't it better to tackle the problem of health from a social standpoint, and isn't all this concentration on treatment of the sick something of a red herring across the trail of social preventive medicine?"—*Birmingham Mail.*

"It is no use resenting the trend to totalitarianism—if by that we mean the increasing restriction of individual liberty by Government. European civilization is moving that way not because it wants to but because it can do no other. Whether it is a good thing or a bad thing is quite a different matter that time alone will decide."—*Medical Press and Circular.*

"By the attitude they have taken up the doctors have administered the first direct check to the planners of bureaucracy. For upon the docility of the medical profession and the consequent passing into law of the comprehensive health service depends the success of the other autocratic State schemes for control."—*Weekly Review.*

BRITISH MEDICAL ASSOCIATION

Election to the Council of a Woman Member

The following candidates have been nominated for election as a woman member of Council for 1944–5: Barbara M. L. Abercromby (Liverpool), Janet K. Aitken (London), Dorothy L. C. Day (Croydon). Voting papers will be issued on Feb. 3, 1945, to women members of the Association.

CHARLES HILL,
Secretary.

Meetings of Branches and Divisions

SUNDERLAND DIVISION

At a meeting of the Sunderland Division on Dec. 20, to which all the profession in the area had been invited, the Division's Representative, Dr. A. A. M. Nicol, gave a very full account of the proceedings at the A.R.M. and of the decisions taken. He explained the policy which would guide the Negotiating Committee in the meetings with the Minister of Health and the matters upon which it would take a stand. It was agreed that the A.R.M. had been successful and that the policy agreed upon was one to which the Division would adhere. A vote of thanks was given to Dr. Nicol for his services. Satisfaction was expressed with the election of Dr. Arthur of Gateshead to the Negotiating Committee, and the Division again affirmed its opposition to any form of service involving local authority control.

£20 3s. 4d.—Dunbarton County (16th donation).
£19 3s. 6d.—East Lothian (15th donation).
£5.—Norfolk (5th donation).

Total—£55,541 7s. 5d. *and* £100 3½% *Conversion Stock and* £40 3% *Defence Bonds.*

Sums for Books for Prisoners of War

Amount previously acknowledged £216 14s. 6d.

Cheques, payable to the Medical War Relief Fund, should be sent to the Hon. Treasurer of the Fund, British Medical Association House, Tavistock Square, London, W.C.1.

ADDITIONAL COAL SUPPLIES IN ILL-HEALTH

Inquiries are being received about the certificate for additional heating on medical grounds recently circulated to doctors by local fuel overseers. The Ministry of Fuel and Power consulted the B.M.A. before issuing the certificate, and pointed out that in order to conserve supplies it was necessary for distributors to know the length of time for which the extra fuel would be needed and there was no certificate already in use which could be adapted to ensure that this information would be included. Although appreciating these difficulties the B.M.A. felt that it could not approve yet another special form, and insisted that where a doctor wished to use a private certificate for this purpose he should be free to do so.

In a letter accompanying the certificate forms the local fuel overseer states: "A medical certificate in a form other than the enclosed . . . may be questioned." This has given rise to misunderstanding. It should be made clear that it does not preclude the use of a private certificate, but that if the period or the gravity of the case is not stated further inquiry may be necessary with additional trouble and inconvenience to all concerned. Where a satisfactory arrangement has already been made between the fuel overseer and local doctors the use of a private medical certificate should not cause any difficulty.

WEEKLY POSTGRADUATE DIARY

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—*Thurs.*, 3 p.m. Bradshaw Lecture by Sir Girling Ball: End-results o Treatment of Growths of the Bladder.

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m., Dr. R. Y Keers: Recent Developments in the Treatment o Pulmonary Tuberculosis.

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE.—*Tues.*, 4.30 p.m. Section of Orthopaedics; 4.30 p.m., Genera meeting of Fellows. *Wed.*, 2.30 p.m., Section o History of Medicine; 5 p.m., Sections of Surger and of Proctology. *Thurs.*, 5 p.m., Section o Ophthalmology. *Fri.*, 2:30 p.m., Clinical Section

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE 28, Portland Place, W.—*Wed.*, 3.30 p.m., Surg Rear-Adml. G. Gordon-Taylor: Surgery and Russia.

ROYAL INSTITUTION, 21, Albemarle Street, W.—*Tues.*, 5.15 p.m., Mr. T. Wallace: Methods o Diagnosis of Mineral Deficiencies.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under thi head is 10s. 6d. *This amount should be forwarde with the notice, authenticated with the name an address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue*

BIRTH

ROSS.—On Jan. 8, 1945, at Beeston Nursing Home Nottingham, to Margaret H. (*née* Wood) an Capt. George Ross, R.A.M.C., B.L.A.—a son.

MARRIAGES

MCDONALD—CADE.—On Jan. 9, 1945, at St Barnabas Church, Dartmouth, Ronald Stewa McDonald, Surg. Lieut., R.N.V.R., to Margare E. Cade, S.R.N.

MACKENZIE—PERRY.—On Jan. 9, 1945, at Hol Trinity, Northwood, by the Rev. G. C. Walke Kenneth Michael Mackenzie, M.B., B.S. Lieut., R.A.M.C., only son of Mr. and the lat Mrs. K. J. Mackenzie, of 6, St. Margarets Road Ruislip, and Rachel Mary, younger daughter o Mr. and Mrs. C. W. Perry, of 40, Eastbur Avenue, Northwood.

WINSTANLEY—PENNEY.—On Jan. 20, 1945, at Chris Church, Heaton Norris, by the Rev. Coli Lamond, Michael Platt Winstanley, M.R.C.S. L.R.C.P., elder son of Dr. and Mrs. Sydney A Winstanley, of Urmston, Lancashire, to Nanc Bennett Penney, M.B., Ch.B., only daughter o Mr. and Mrs. William Penney, of Heaton Chapel

DEATHS

RICHARDS.—On Jan. 13, 1945, at Coventry, Majo Henry Edward Sutherland, M.C., T.D., R.A.M.C (T.F.), (ret.), husband of Kathleen (*née* Wollaston), late Principal Medical Officer, Granada Windward Islands, in his 69th year.

WEST.—On Jan. 26, 1945, at Belmont, Hoddesdo Hertfordshire, Leonard West, M.B., Ch.B., J.P son of the late Thomas Edward West, of Leeds.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY FEBRUARY 10 1945

MEDICAL PLANNING IN AUSTRALIA

B.M.A. FEDERAL COUNCIL STATES ITS POSITION

While Great Britain is contemplating proposals for a National Health Service a similar situation is slowly maturing in Australia. The problems in both countries are very much alike—a resemblance only to be expected, as the *Medical Journal of Australia* points out, seeing that the people are of a common stock, enjoy the same kind of constitutional Government, and are served by a medical profession whose members are welded together by a heritage of ideals and traditions.

The Commonwealth Government has announced that it desires to establish a national medical service, financed by taxation, and available to every member of the community. The Government intends to go ahead with that policy whether the profession agrees to co-operate or not, but it is apparent that it would rather have such co-operation than otherwise. It hopes to find recruits for its service from medical officers of the armed Forces on their demobilization and from students who are receiving financial assistance from the Government to study medicine in the several medical schools of the Australian universities.

A Parliamentary Joint Committee on Social Security has been studying medical reconstruction among other matters, and has issued an interim report on that subject as well as reports on related services. The Joint Committee consists of representatives of all political parties in Australia, and must not be taken as necessarily expressing the view of the Curtin Government; nevertheless it does indicate, in the words of an Australian observer, "the direction from which the political wind is likely to blow." There is also in existence a body called the National Health and Medical Research Council, which was set up to advise the Commonwealth and State Governments on all matters of public health legislation and administration. This body has made it a cardinal principle that before any decision is reached full discussion must take place between the Government and the medical profession, but it appears that the Commonwealth Government does not always heed that advice, for a Pharmaceutical Benefits Bill, closely affecting the medical profession, has recently been brought in without such consultation.

National Health Insurance Not Favoured

The Parliamentary Joint Committee, to which the President of the Federal Council of the British Medical Association in Australia (Sir Henry Newland) and the General Secretary (Dr. J. G. Hunter) gave evidence, issued an interim report in 1943. The issue of the report was preceded by a letter by the chairman of the committee, Mr. H. C. Barnard, M.P., who stated that there was a unanimous objection to the National Health Insurance system as put forward in a Commonwealth Act of 1938 and in subsequent legislation or proposed legislation. The grounds of objection were the restriction of benefits to a particular income group, the limited range of such benefits, and the absence of any provision for dependants. He declared that there was general opposition to the panel and capitation system, "which has been discredited in Great Britain, and more recently in New Zealand, where a fee-for-service system has been introduced." The Parliamentary Joint Committee therefore strongly advised the Government to take no further action to implement the provisions of National Health Insurance legislation. The committee, he added, would proceed with the inquiry into forming a comprehensive health scheme, which it proposed to discuss with representatives of the medical profession before preparing a report to Parliament. In the meantime he considered that to bring in any major scheme of medical or related services would jeopardize the success of a comprehensive scheme at a later stage, and would be considered precipitate by the medical profession and vigorously opposed.

Good relations, said this chairman, had been established between the Parliamentary Joint Committee and the profession, "and we see no difficulty in cultivating the co-operation of the profession so long as adequate time is allowed for working out the necessary details and for consultation not only with representatives of the B.M.A. but with individual representatives of the profession." Meanwhile certain non-contentious measures, such as those relating to nutrition and maternal welfare, might proceed.

Federal Council's Plans

The Federal Council of the B.M.A., rather late in the day—in the autumn of 1943—set up a Planning Committee with definite terms of reference, and asked the six Branches in Australia to appoint similar committees. The Federal Council has been troubled a little by uncertainty as to its powers to bind the Branches, which were originally quite separate entities until the Federal Committee was formed in 1913, and later gave place to the Federal Council. After some long discussion last year the Federal Council came to the conclusion that the present arrangement between itself and the Branches, which is binding in honour only, is preferable to a legal agreement.

A number of the recommendations contained in the interim report of the Joint Parliamentary Committee were approved by the Federal Council, but to others it was unable to give approval. One paragraph which failed to secure approval advocated a full-time salaried medical service as affording the only satisfactory basis for a National Health Service. In "remote" areas—that is, areas of 1,000 people or more resident within a radius of 25 miles and unprovided with a doctor—the Joint Parliamentary Committee proposed that there should be a voluntary full-time salaried medical service under a "limited-term" appointment, and this was approved by the Federal Council, though it was intimated that a subsidized service would be preferred. But approval was not given to a further proposal that in other areas, country and town, there should be a part-time salaried service under a system of voluntary participation by general practitioners. The idea was that these doctors, while maintaining their private practice, should indicate what number of half-day sessions they would be willing to devote to a general medical service, the service to be provided at out-patient and consultant clinics, which would be equipped with diagnostic and treatment facilities and supervised by a salaried medical liaison officer responsible to the central administration. The general control of the clinics would be vested in the medical personnel of each.

The view of the Federal Council was that the proposals of the Parliamentary Joint Committee for out-patient and consultant clinics represented the first instalment of a drastic alteration in the form of medical services, and to any such alteration during the war, and for one year afterwards, it offered strong opposition. It did not object, however, to another recommendation, for the immediate establishment of a number of group-practice centres under suitable conditions. Its governing resolution read as follows:

> "That the Federal Council of the British Medical Association in Australia is opposed to a socialized medical service as it considers that it is not in the public interest that the medical profession should be converted into a salaried branch of the Government service."

As against any Government scheme which might prove unacceptable, the Federal Council agreed that a scheme emanating from the Victorian Branch, incorporating a fee-for-service principle, should be submitted to the Branches for their consideration as one acceptable substitute.

Hospitals Free to All

Another point urged by the Federal Council was that if any fresh expenditure on health services was contemplated by the Government during the war it should be primarily for the improvement of the hospital services. On this question of the hospitals the Commonwealth Government has requested the advice of the Parliamentary Joint Committee on a hospital benefit scheme. The committee is recommending an arrangement whereby the Government would pay from exchequer funds a subsidy equal to 6s. 6d. per daily occupied bed, for general medical, surgical, and obstetric cases. The subsidy would be subject to certain conditions, the first of which is that public bed accommodation should be provided for patients without additional charge. Any savings resulting from the payment of the subsidy will be paid into a trust fund for the expansion and improvement of hospital services.

The sum of 6s. 6d. a day, of course, does not cover the cost, but the amount was decided on as representing the highest average of revenue from patients' payments. To this have to be added the sums paid by the State Governments (reaching as high as 9s. 2d. per daily occupied bed in Queensland) and the sum obtained by donations. The payment of the subsidy is held to justify the abolition of any means test; in fact, it opens the doors of all public hospitals to all persons regardless of their ability to pay fees for medical treatment. It will inevitably bring about the end of the honorary system of medical attendance.

Later Developments

In the effort to seek agreement between the Government and the medical profession a Social Security and Health Services Conference was held at Canberra at the end of 1943, as a result of which certain matters were referred for exploration to a new Medical Planning Committee consisting of three representatives of the Parliamentary Joint Committee, three representatives of the British Medical Association in Australia, two representatives of a Social Security Medical Survey Committee, and a representative of the Commonwealth Director-General of Health. The conference led to wrongful statements in the lay press to the effect that the British Medical Association had agreed with the Commonwealth Government on a health service scheme for all Australia, when, in fact, it had only agreed on the principles which should govern a service, and all decisions had been tentative and without commitment. But, as the *Medical Journal of Australia* remarks, "When no Australian newspapers publish inaccuracies about the British Medical Association the millennium will have arrived."

The new Joint Medical Planning Committee has issued an interim report—a long document, comparable in extent with our own White Paper. It covers the ground of public health, hospital and ancillary services, and medical services. On the question of public health it ranges over the population problem, economic conditions, maternity and child welfare, the pre-school and school child, national fitness, nutrition, industrial hygiene, and the campaigns against tuberculosis and venereal diseases. On hospital services it proposes a Commonwealth expert advisory body charged with the responsibility of advising hospitals on planning, construction, and equipment, and, among other matters, it calls for a decentralization of out-patient services.

Concerning medical services, the report upholds the principle of the preservation of the doctor–patient relationship and of free choice. In the "remote" areas it favours a voluntary full-time salaried, or subsidized, medical service under a "limited-term" appointment, with improved hospital and transport provision and the services of the "flying doctor," and it adds that in all such appointments the emoluments and conditions of service should be such as to make the post attractive to a good type of competent doctor, and in particular they should include specific facilities for adequate postgraduate study. In the country (as distinct from the remote) areas, recommendations are made for consulting-room, domiciliary, and institutional practice, and a much closer collaboration is called for by more effective methods of communication and exchange of information between the hospital and the general practitioner.

In urban areas a method put forward by the British Medical Association for the evolution of a hospital system on a regional basis is supported by the committee, which also favours the scheme—originally turned down by the Federal Council—whereby doctors in such areas would retain their private practices but would agree to serve on a part-time salaried basis for a stipulated number of half-day sessions at out-patient and consulting centres. These would be, in effect, group-practice clinics, and the committee takes the view that experimental group practices at carefully selected places should be established so that different sets of conditions, types of practice, and methods of payment could be tested out.

Conference with the Government

At the end of September last a committee of the Federal Council was invited by the Minister for Health, Senator Fraser, to meet Government representatives "in order to formulate, if possible, plans for a medical service based on the policy that the service would be available to every member of the community without cost apart from taxation." The invitation was accepted, not without some misgiving based on the experience of previous Government conferences. Too often, apparently, in Australia, Ministers look upon a conference as nothing but an opportunity for a statement of Government intentions. In a leading article in its issue of Oct. 28 the *Medical Journal of Australia* refers caustically to the "peculiar ideas" of Ministers of the Crown as to what a conference is, and of the patience and long-suffering of the medical profession. At a previous conference, held in June, the Treasurer, who is the second figure in the Government, declared that a plan had been laid down, that apparently the medical profession would not co-operate, but that the Government intended to go on with its policy all the same. "All members of the profession," says the journal, ". . . whatever their views on medical politics may be, will regret this stand-and-deliver attitude."

However, the new invitation was accepted, and in long discussions for three days beforehand the Federal Council considered the instructions to be given to its six representatives. Eventually the discussions were crystallized into a number of resolutions, the first five of them moved by Dr. H. C. Colville of Victoria:

(1) To enter an emphatic protest against the formulation by the Government of a scheme involving a drastic alteration in the form of medical service to the community during the war or for one year afterwards.

(2) To make a formal request that such a scheme shall not be formulated during the specified period.

(3) To inform the Government that the Government policy having been stated to be a free medical service to all, with control by Government Department and a contract for service between the Government and the doctor, the Federal Council is agreed that such a policy is not in the public interest and is not acceptable to the Federal Council.

The fourth motion was an offer to the Government of the fullest co-operation of the Federal Council in bringing about certain specified improvements in maternal and child welfare and in dealing with tuberculosis.

(5) To inform the Government representatives that the Federal Council will be willing to discuss any scheme put forward by the Government for the expenditure of public money on the provision of financial relief for individuals arising out of illness in which the following conditions are observed: (*a*) that the negotiations shall not proceed beyond the stage of discussion until one year after the war; (*b*) that the scheme should retain the existing doctor-patient relationship; and (*c*) that the scheme shall be free from departmental or any other method of control which would interfere with the freedom of the profession and the public.

(6) To inform the Government that the Federal Council considers that in any scheme the individual, unless his financial circumstances so preclude, should retain some share in the financial responsibilities of his illness

No report is to hand as yet concerning this conference, but the general outcome appears to be a determination to keep the door open for further discussions. Since then the General Secretary of the Federal Council and the Medical Secretary of the Victorian Branch have visited New Zealand to study the fee-for-service system operating there, and the Minister for Health also proposes to visit New Zealand, presumably with the same object in view. It will be recalled that the New Zealand system came in for some unfavourable comment at the recent Annual Representative Meeting in London.

Views of the Australian Branches

At the same meeting of the Federal Council which gave instructions to its representatives the views of the Branches were reported on two questions referred to them by headquarters—namely, whether their members would be willing to participate in the working of a medical service which was available without cost to every member of the community, subject, of course, to conditions for practitioners being satisfactory, and, if this was so, what form of administration would be preferred, and what form of contract, including method of payment. The replies of the Branches may be summarized very briefly as follows:

Tasmanian.—No drastic change should take place until Service medical officers could take part in the deliberations. Detailed administration must be in the hands of an executive body, the majority of whose members should be appointed by the organized profession. The fee-for-service principle preferable if a proportion of the total fee was paid by the patient, but if complete freedom from direct cost had to be accepted further consideration should be given to a capitation system. Salaried service not acceptable.

South Australian.—Need for the Government to bring out a White Paper for transmission to the profession throughout Australia. Meanwhile, as proposals were still tentative, negotiations with the Government should be carried on.

New South Wales.—Government policy for a free service to every member of the community, with control by a Government Department, and a contract for service between Government and doctor, not in the public interest and not acceptable to members. Regimentation of both patients and practitioners inseparable from any Government scheme of free curative service departmentally controlled, and this was inimical to maximum efficiency and public confidence. Existing doctor-patient relationship must be maintained.

Victorian.—Members would be prepared to accept a scheme for a complete medical service available without cost to every member of the community only if it was conducted in accordance with certain resolutions which the Branch had adopted in January, 1944. Government proposals for a nation-wide medical service unacceptable. The only acceptable form of contract with the Government would be a broad general agreement covering schedules of fees and cognate matters.

Western Australian.—A scheme whereby some direct payment was made by the patient would be preferable to the free-for-all service proposed. Administration should be in the hands of a corporate body directly responsible to Parliament through the Minister and on which the practising profession should be adequately represented. Payment should be on a fee-for-service basis, except where the corporate body considered that a salaried or capitation method would result in more efficient service, but no such method should be inaugurated until sufficient practitioners were available to man the service efficiently. No one form of contract would be suitable for the whole of Australia.

Queensland.—A salaried basis for a nation-wide service not in the best interests of the community, and therefore not acceptable to the profession. If a general medical service was introduced, an income limit should not be imposed.

Although no resolution was passed on the subject, the view of the Federal Council appeared—to be against a corporate body. One member cited the Australian Broadcasting Commission as a warning example. This body had an ideal constitution, and its members had knowledge and ability, but gradually their powers had been cut down until the Commission was at the present time merely a means of Government.

The endeavours of our Australian colleagues to establish a satisfactory system of medical service will be followed with sympathy in this country, despite our own preoccupations. They have, as they acknowledge, learned something from us, and we may well learn something from them. They are concerned about the same issues, the form of control and contract, the 100% availability, the preservation of the principle that the first duty of the doctor is to his patient and not to a State-employer. A word should be said in appreciation of the Federal Council. In this country some members of the Central Council of the B.M.A. and its committees excite our admiration because they have travelled 400 miles to attend a meeting, but in Australia some have to travel 2,000 miles to attend the Federal Council, which usually meets at Melbourne or Sydney, and the difficulties of organizing meetings of the profession are correspondingly great. All the more outstanding is the achievement whereby organized medicine in Australia has been enabled to speak with a clear voice.

Correspondence

Medical Demobilization

SIR,—May I add my contribution to the recent correspondence on demobilization because mine is in many ways a typical case and I believe my views represent those of many other medical officers in the Forces.

I qualified in July, 1939, at the age of 29, having taken up the study of medicine rather later in life than usual. In September, 1940, I joined the R.A.F., and now, with four years and four months' service at the age of 34, I find myself in the age-service release group of 23—that is to say, in the same group as the man who joined up in September, 1939, at the age of 24 or the man who joined up at the age of 36 in September, 1941.

When the Government scheme for release was first published I allowed myself some sanguine thoughts about the prospect of release fairly soon after the defeat of Germany. How far my optimism was removed from reality may be judged by the fact that I was recently warned for over-seas and that in a few days I am to go on a course in tropical medicine. I do not know my destination, but believe the Far East is the most likely place.

There is a Government promise that no matter where a man is he will be brought back for release with the rest of his group, and if this promise is to be kept it seems unlikely that any man with a reasonable chance of early release would be sent to a far-distant place. I therefore conclude that I possess no such chance. I mention the question of overseas because it seems to me to throw some light on the prospects of release in terms of age-service groups. I do not and could not have any objection to going over-seas, because only six months of my service have been spent out of this country, a previous tour of duty having been terminated by a disability from which I have now recovered.

It is possible to state briefly what service in the Forces has meant to men like myself qualified just before or at the beginning of the war. It has seriously and perhaps even irretrievably damaged the chances of most of us of reaching the higher places in our profession. It has made us spend many years in a form of medical practice which, however useful in itself, is not generally reckoned to be valuable experience for most forms of civil practice. It has meant the disruption of family life, and I, who see my wife and children at three-monthly intervals for a few days, am luckier than a good many men who have been overseas for a long time.

How does this compare with the fate of those of our contemporaries who have so far remained in civilian life? Those who were able to follow the A—B2—B1 path through the hospitals, not always because of outstanding ability but often because of lack of competition, have been able to obtain invaluable experience and high qualifications with the permanent kudos resulting therefrom. Others in general practice, because their districts contained other doctors with Territorial or Reserve obligations or older men who felt they should join the Forces, have been left undisturbed. I quote these facts not to disparage the individuals concerned or to minimize the value of their work but to illustrate that circumstances have given them a big advantage, whether in professional experience and standing or in establishment in practice, over their contemporaries in uniform.

The Government plan for interim demobilization is, by definition, a scheme for reallocation of man-power. As regards the medical profession it should allow an exchange of doctors between the Services and civilian life whose magnitude depends on the energy and thoroughness with which it is administered. If the Central Medical War Committee takes the narrow view it will regard the scheme merely as a method of disposing of Service medical officers surplus to requirements after the defeat of Germany. On the other hand, if it believes that the notion behind the scheme is to use that surplus in order to effect as wide as possible a redistribution of the hardships of service in the Forces, it will concentrate mainly on recruitment.

Clearly every man released from the Services will eventually find his way into a civilian job and will thus free another man who may be eligible for recruitment. Once this scheme is in operation and made a continuous process a steady flow to and from the Services should result even after the release of the initial surplus. Let us suppose, for argument, that releases begin in September, 1945. I shall then be 35 years old with five years' service to my credit. I submit then that I shall have grounds for resentment if I cannot be released while any doctor of that age or under remains in civil life who has not served in the Forces and who is fitted by sex, nationality, and physical fitness to do so.

The profession must realize that many doctors will continue to serve, often in unhealthy climates, separated from their families, and cut off from all hopes of professional advancement, until after the defeat of Japan. It would be wrong, therefore, to adopt a "back to peacetime" attitude or to let such an attitude result in a tendency to expect absent partners, etc., to be released under Clause B. Every young man not called up and every man released out of turn means further delay in the release of people like myself, who can ask for no priority but do expect to get fair treatment.

This release scheme and its possibilities has aroused mixed feelings in me and in many other Service medical officers, and it would be a consolation if we could be assured that the points I have mentioned would receive the most sympathetic consideration of the Central Medical War Committee, and that we will really see an attempt to bring about a reallocation of medical man-power in the widest sense.—I am, etc.,

"SQUADRON LEADER G,"
R.A.F.V.R.

Certification for Priority Milk

SIR,—If the B.M.A. intends to lodge any protest on this matter it is to be hoped, and it may be assumed, that it will be phrased somewhat more happily than the contribution by your correspondent Dr. H. A. Treble (*Supplement*, Jan. 20, p. 9). His analysis of the motives alleged to actuate the Ministry of Food was masterly in that, while his second point might be justified as a personal opinion, the first was so sweeping as largely to discount its value, while the third merely provided a gratuitous reflection upon his professional brethren in the public health service.

It is not commonly suggested in your columns that general practitioners are under the influence of their patients when certifying, and, so far as I know, neither tuberculosis officers nor medical officers of health are in any position to fear the Ministry of Food. Perhaps, however, Dr. Treble could—by presenting some definite evidence—correct me on this latter point?

Until infectious disease blocks are more generally associated with general hospitals I should have imagined that the more certain the physician was in his differential diagnosis the less he would subsequently have had to do with cases of enteric and dysentery. I am not concerned here to discuss the Ministry of Food and its actions, since "bureaucrats" (a conveniently vague and omnibus term) share with the medical profession the faculty of collectively not always agreeing with one another, while at the same time failing individually to please everyone. If a member of one section of our profession must criticize practitioners in another the opportunity should at least be taken to advance facts and not merely to evince prejudice.—I am, etc.,

Stalybridge. JAMES GORMAN.

MEDICAL ATTENDANCE ON ITALIAN P.O.W.

When Italian prisoners of war who are working on farms, etc., in this country require medical treatment they are normally attended by a military medical officer or by a civilian medical practitioner employed at fixed daily rates of payment. It sometimes happens, however, that such a doctor is not available and a civilian practitioner is called in. In this case the civilian practitioner giving the treatment should claim a fee on Army Form O.1667, which should be sent to the Deputy Director of Medical Services of the Army Command concerned. The rates laid down in that form will be paid. It is emphasized that a civilian practitioner may be called in only when treatment from existing military services is not available.

PLANNING MEDICAL EDUCATION

Addressing a meeting of the Society of Individualists and National League for Freedom on Jan. 18 Sir E. Graham-Little said that some of the recommendations of the Goodenough report had a totalitarian flavour, particularly in the proposals to direct students to schools with the object of relieving congestion in London, to abolish certain of the Scottish schools, to remove certain of the London schools from London, and, more significantly still, to create two categories of students at the medical schools—those training to be general practitioners and those training to be specialists. During the war the Minister of Health called upon the qualifying bodies to reduce their curriculum in its final clinical stages by 6 months, and this had been done. It was now proposed that the training of the general practitioner should occupy some 4½ years instead of the average of 6 required before the war, and of the consultant some 10 years. It was also suggested that the cost of medical education should be borne in large measure by the State; there was always the danger that when the State paid for this education it would also prescribe its scope and content. The medical profession, Sir Ernest continued, had at last become aware of what was "cooking" for it at Whitehall, and a remarkable explosion of feeling had come about. The doctors, realizing the threat from centralization of control, had become progressively hostile to it. The feeling of the profession was most accurately conveyed in the resolutions of the Representative Body of the B.M.A., which had been, not unjustly, called the parliament of the profession. Unless the Minister withdrew those proposals which conflicted with the profession's recommendations there was little prospect of obtaining the number of doctors essential to carry out the recommendations of the White Paper. We had seen the Education Act held up by a similar dearth of teachers, and the Minister of Education had been obliged to flood the schools with recruits. No such expedient could be adopted in medicine, and the position of the Minister of Health would seem likely to become even more difficult than that of the Minister of Education.

H.M. Forces Appointments

ARMY

War Subs. Major M. F. Nicholls, R.A.M.C., to be a Consultant, and has been granted the local rank of Brig.

ROYAL ARMY MEDICAL CORPS

Major E. G. Dalziel, M.C., to be Lieut.-Col.

Capt. B. Lapedus has retired on account of disability.

Short Service Commission.—Lieut. (War Subs. Capt.) T. A. Reed, from R.A.M.C. (Emergency Commission) has been granted a short service commission in the rank of Lieut., and to be Capt.

SUPPLEMENTARY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

War Subs. Capt. J. T. Hemingway has relinquished his commission on account of disability, and has been granted the honorary rank of Capt.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. A. H. H. Fraser has relinquished his commission on account of disability and has been granted the honorary rank of Major.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Lieut.-Col. G. MacDonald has relinquished the local rank of Brig.

War Subs. Capts. H. R. W. Hawson and D. Harkins have relinquished their commissions on account of disability, and have been granted the honorary rank of Major.

War Subs. Capts. C. A. Palfrey, R. Murphy, I. W. Gallant, A. P. Nicolle, A. J. Patenall, and E. Joffe have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

Lieut. J. K. Ogden has relinquished his commission on account of disability, and has been granted the honorary rank of Lieut.

To be Lieuts.: A. J. H. Aitken, C. H. Barnett, C. A. Barrett, L. S. A. Boothroyd, D. L. Broadhead, E. D. Cameron, F. B. E. Charatan, H. H. Collins, M. D. M. Collins, G. N. C. Crawford, J. McC. Dunlop, M. Ernest, A. M. Evans, F. N. Forster, B. J. Fowler, L. Frain-Bell, J. E. French, M. B. Garnett, S. R. S. Godkin, L. D. Golding, D. Headley, G. C. Hildrey, P. S. Kenny, E. Levy, W. Levy, O. C. Lord, T. R. Macdonald, A. I. Maclean, J. Mutch, J. T. Patton, D. H. Rees, D. L. Rees, J. J. Rivlin, A. J. Robertson, J. S. Robson, T. H. L. Rosser, J. H. Sherrey, R. G. Simpson, W. D. Sinclair, S. Smith, S. A. Styles, R. G. Tasker, W. G. Todd, W. G. Toole, B. Townsley, E. L. Barr, S. E. Bolton, W. St. J. Buckler, D. A. Forbes, R. D. Harland, J. Hart, C. B. Holmes, H. J. Houghton, C. B. Lanyon, I. Macleod, B. G. Paul, T. M. Pole, M. H. Russell, R. G. Seaver, E. F. R. Todd, J. L. Wakelin, E. G. Wright.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

The following M.O.s have been granted commissions in the rank of Lieut.: Thelma C. Cruickshank, Mary R. Ellis, Kathleen L. Prendergast, Renate H. Schulz, Isabel F. Sutherland, Edith A. C. Thomson.

ROYAL AIR FORCE

Wing Cmdrs. (Temp. Gp. Capts.) R. H. Stanbridge and R. W. White to be Gp. Capts.

Squad. Ldrs. (Temp. Wing Cmdrs.) C. G. Harold and T. C. Macdonald, A.F.C., to be Wing Cmdrs.

Fl. Lieuts. (Temp. Wing Cmdrs.) R. S. Peill, H. E. Bellringer, R. S. B. McClean, J. B. Wallace, G. H. Stuart, and D. J. Sheehan to be Squad. Ldrs.

Fl. Lieuts. (Temp. Squad. Ldrs.) R. F. Wynroe and L. N. Trethowan to be Squad. Ldrs.

ROYAL AIR FORCE VOLUNTEER RESERVE

Squad. Ldr. (Temp.) D. J. Williams has been granted the rank of War Subs. Squad. Ldr.

Fl. Lieut. E. B. Davies has been granted the rank of War Subs. Squad. Ldr.

Flying Officers J. Littler, D. H. Makinson, P. M. Ransford, O. L. S. Scott, R. D. Sweet, C. G. K. Thompson, and I. A. M. Thomson to be War Subs. Fl. Lieuts.

Flying Officer D. P. Fitzgerald has relinquished his commission on account of ill-health, retaining his rank.

WOMEN'S FORCES

EMPLOYED WITH THE MEDICAL BRANCH OF THE R.A.F.

Fl. Lieut. K. M. Poad has relinquished her commission on account of ill-health.

Flying Officers B. M. Corrigan, D. R. B. O'Brien, M. Small, and E. M. Troy to be War Subs. Fl. Lieuts.

INDIAN MEDICAL SERVICE

Major B. S. Nat to be Lieut.-Col.

COLONIAL MEDICAL SERVICE

The following appointments have been announced: J. G. A. McSorley, M.B., Medical Officer, Nigeria; F. J. C. Johnstone, M.D., D.P.H., D.T.M., Director of Medical Services, Gold Coast; W. J. Branday, M.R.C.S., Assistant Director of Medical Services (Hospitals and Personnel), Jamaica.

POSTGRADUATE NEWS

The National Association for the Prevention of Tuberculosis announces the following Tuberculosis Refresher Courses: Manchester, April 23 to 28; Hairmyres Tuberculosis Colony, Lanarkshire, June 26 to 28. Particulars may be had from Dr. Harley Williams, Tavistock House North, London, W.C.1.

WEEKLY POSTGRADUATE DIARY

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m., Dr. A. E. Ritchie: Physiology of Peripheral Nerve Injury.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—*Wed.*, 3.30 p.m., Hunterian Oration by Prof. G. Grey Turner: The Hunterian Museum.

ROYAL SOCIETY OF MEDICINE.—*Tues.*, 2.30 p.m., Section of Psychiatry. *Thurs.*, 5 p.m., Section of Dermatology. *Fri.*, 5 p.m., Section of Obstetrics and Gynaecology; 6.30 p.m., Section of Radiology.

BRITISH INSTITUTE OF RADIOLOGY, 32, Welbeck Street, W.—*Thurs.*, 8 p.m., Mr. L. Dudley: Stereoscopic Photography and Radiography. *Fri.*, 5 p.m., Medical members' meeting.

FACULTY OF RADIOLOGISTS: THERAPY SECTION.—At Royal College of Surgeons of England, Lincoln's Inn Fields, W.C., *Fri.*, 2.30 p.m. Discussion: Ankylosing Spondylitis. Openers, Drs. R. McWhirter, W. Wyatt, and F. Hernaman-Johnson.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.—*Mon.*, 5 p.m., Discussion: Uses and Limitations of Penicillin Treatment. To be introduced by Sir Alexander Fleming, F.R.S., and Dr. T. Izod Bennett.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, W.—*Wed.*, 3.30 p.m., Dr. G. H. Newns: The Problem of Infant Mortality.

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE, 26, Portland Place, W.—*Thurs.*, 3 p.m., Prof. P. A. Buxton, F.R.S.: Use of the New Insecticide DDT in Relation to the Problems of Tropical Medicine. A discussion will follow.

B.M.A.: Branch and Division Meetings to be Held

LEIGH DIVISION.—At Boar's Head Hotel, Leigh, Sunday, Feb. 11, 3 p.m., Meeting. Address by Mr. F. H. Scotson: Penicillin.

NORTHERN IRELAND BRANCH.—Joint meeting with Ulster Medical Society at Whitla Medical Institute, College Square North, Belfast, Thursday, Feb. 15, 8.15 p.m. Addresses by (*a*) Prof. J. H. Biggart: Problems in the Pathogenesis of Rheumatic Fever and Subacute Bacterial Endocarditis; (*b*) Dr. Florence McKeown: Experimental Production of the Specific Rheumatic Lesion; (*c*) Dr. Yvonne Murray: Experimental Subacute Bacterial Endocarditis.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTH

BROWN.—On Jan. 31, 1945, at Maidstone, to Judy, wife of Dr. R. Crosbie Brown, H.M. Prison, Maidstone, a sister for Robin—Audrey Ann.

DEATHS

LOUDON.—At Linnwood, Hamilton, Lanarkshire, on Jan. 15, 1945, James Livingstone Loudon, M.D., C.M., F.R.F.P.S.(G.), D.P.H., former Medical Officer, Burgh of Hamilton, in his 80th year.

WILKINSON.—On Jan. 2, 1945, at 5, Chester Road, Poynton, Cheshire, Arthur Thomas Wilkinson, M.D., F.R.C.P., late Honorary Consulting Physician and Dean to the Manchester Royal Infirmary, aged 91 years.

The Secretary of State for Scotland has appointed Dr. R. J. Peters to be Deputy Chief Medical Officer in the Department of Health for Scotland; and the appointment of Dr. W. D. Hood as a senior medical officer in the Department is also announced. Dr Peters entered the service of the Glasgow Public Health Department in 1921, was appointed deputy medical officer of health for the city in 1935, and senior deputy medical officer in 1939; he has recently been associated with Prof. J. M. Mackintosh and Prof. G. F. W. Illingworth in carrying out a survey of hospitals in the West of Scotland. Dr. Hood joined the staff of the Department of Health for Scotland in 1938 and has been chiefly engaged on the establishment and development of the Emergency Hospital Services.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY FEBRUARY 17 1945

HEARD AT HEADQUARTERS

With this issue we are reviving a series of notes on B.M.A. activities, contributed, not officially, by a detached but informed observer.

Lay Audiences and the White Paper

Recent experience has revealed the remarkable interest in the White Paper which lay audiences are displaying at public meetings addressed by the Secretary. For instance, a meeting was held last year at Bradford with an attendance of 2,000; another was held at Harrogate in a full hall holding some 700, a large crowd being turned away. A meeting held recently at the Dome, Brighton, was attended by about 1,800. At Grimsby a charge was made for entrance; over 2,000 applications were made for some 900 seats. Another large meeting was held recently in Glasgow under the auspices of the Glasgow Philosophical Society. Well-attended meetings of Rotary Clubs have been visited in all parts of the country. Similar public meetings are planned for Oldham, Coventry, and elsewhere.

There was an interesting and very successful experiment in Spalding at which doctors, doctors' wives, Members of Parliament, and representatives of public life and the Press were invited to hear an address by the Chairman of Council.

As a result of such meetings the effect of the White Paper proposals on the individual citizen is becoming better understood. A word of thanks should be said to the Honorary Secretaries of the Divisions who have organized these and other similar meetings—a difficult task at any time, and particularly difficult just now.

Charter for Health

The medical practice aspects of a National Health Service, being more controversial, have overshadowed the primary importance of environmental medicine, of which, however, the Association has never lost sight. Last December the Council set up a committee to prepare, for the information of the public, a statement of the profession's views and suggestions concerning housing, nutrition, and like matters. It has been very fortunate in obtaining the services as members of the committee of a number of persons distinguished in the various fields of nutrition, social biology and hygiene, public health and education, and maternal and child welfare. Sir John Boyd Orr is chairman of the new committee, and other members include Brig. F. A. E. Crew, Prof. Lancelot Hogben, Prof. J. A. Ryle, Prof. J. M. Mackintosh, Dame Janet Campbell, and Brig. J. R. Rees. Industrial medicine is represented by Dr. N. T. Glynn, and the education service by Mr. J. H. Newsom, chief education officer of the Hertfordshire County Council. In addition a number of members of the Association Council, with wide experience of practice, will prevent any tendency, should such arise, for the committee to become too academic or specialist. They have already got to work in preparing a "Charter," to consist of short, concise statements of the opinions of medical science on the basic facts of health. A number of experts, members of the committee, and others, have been invited to submit memoranda.

Late Replies

A few late replies to the Questionary have been received from Service doctors. They number 267, or about one-tenth of the total number received from those serving and a little more than 1% of all the replies. Naturally, so small a number, whatever opinions they expressed, could not modify the result. But in fact these late replies follow the same lines as the other Service answers, the analysis of which was published on August 5 last. In only one instance is there more than 5% difference. This is in the answer to the question whether the introduction of a National Health Service would mean that medical service in the country as a whole would be enhanced or would suffer. Of the late replies 48% considered that it would be enhanced, as against 41% of the replies already published.

The reactions to the White Paper show these late replies are favourable in 57% and unfavourable in 37%, as against 52 and 41% respectively in the bulk of the Service replies. On the 100% issue, 71% of these latest Service doctors expressed themselves in favour of accepting the basic proposal in the White Paper, as compared with 73% of their colleagues who had replied earlier.

General Practitioner Hospitals

The small general hospital staffed by general practitioners must not be lost sight of in the gravitational changes affecting the hospital world. The last Representative Meeting urged the importance of preserving and developing these hospitals to serve as nuclei of one type of Health Centre.

That is what they might well be—one of the experiments in group practice which the Association has urged should be undertaken before the Health Centre idea is fully accepted. Hitherto, however, the Association has spoken of this matter only in generalities. It was felt at the recent meeting of the Hospitals Committee that it was time to "come to the 'osses," getting down to details and saying, not merely that this should be done, but how it should be done. A small committee consisting of members of the Hospitals Committee and other people outside it has been set up to explore the question.

More Certificates

A form of medical report of unusual volume was placed before the Hospitals Committe of the B.M.A. at the same meeting. It is a report required from hospitals by the Ministry of Labour concerning patients who are about to be discharged with a residual disablement. In its covering communication the Ministry said that "the document at first looks formidable," and it does indeed, both first and last.

The chairman of the committee, Mr. R. L. Newell, said that he had improved his journey from Manchester by trying to fill it up for a hypothetical case, and he came to the conclusion that it would take him two hours. Another member said that to fill it up adequately he would have to be a physician, a surgeon, and a psychologist, not to speak of an ophthalmologist and otologist, and have to know something about occupational therapy and works' hygiene. It is, in fact, the kind of report which cannot be dealt with by one doctor, but will have to be passed from one consultant or one department to another. For filling in this report a fee of 10s. 6d. is proposed by the Ministry. The committee designated two of its members to meet the author of the document with a view to some simplification.

In addition to this, under the Disabled Persons (Employment) Act passed last year it will be necessary in many cases for the disabled persons to obtain a doctor's certificate, and a standard form (R.D.X.) has been drawn up. For this the Ministry suggests a fee of 2s. 6d. to be paid by the applicant. The General Practice Committee has suggested 10s. 6d. to be paid by the Ministry.

These reports and certificates on disablement are likely to be onerous, for under the scheme for the training and resettlement of disabled persons there will be, first of all, an ascertainment of persons already disabled, many of whom have been disabled for years; moreover, the disablement relates to the result not only of injury but of organic disease.

DOCTORS' PROFESSIONAL VOTE

Doctors who have professional premises in another district from that in which they live are entitled to a professional vote for those premises. This applies with particular force in London to doctors with professional premises in the Marylebone parliamentary division. They should note, however, that under the new Registration of the People Act they will not be entitled to such a vote unless they first complete the necessary form, which can be obtained from their town hall or local council's office, and return it to the Local Electoral Registration Officer of their district before Feb. 28 next—that is, within ten days' time. Doctors who fail to do this will be unable to record their professional vote at the general election. It should also be noted that the husband or wife of an occupier of professional premises is no longer eligible for the vote for those premises.

INSURANCE ACTS COMMITTEE

STANDARDS OF REMUNERATION INQUIRY

The Insurance Acts Committee at its first meeting of the new session on Feb. 1 re-elected Dr. E. A. Gregg as its chairman and reappointed its Rural Practitioners' and other subcommittees.

It was stated that the Minister would shortly announce the composition and terms of reference of the Government Committee of Inquiry on Standards of Remuneration. The chairman would be a well-known figure in the educational world, who had presided over or been a member of several statutory commissions and courts of inquiry. The four medical members would be as recommended by the Association. The names on the other side were not yet announced, but it was believed that they would command the confidence of the profession and the public. There would be two joint secretaries, one appointed by the Minister and the other (Dr. Kelynack) a member of the Association staff.

The desire of some members that the committee charged with the collection and presentation of evidence to this Government body should have a wider areal representation was voiced in the Insurance Acts Committee. It was urged that practices did differ markedly in various parts of the country, and that on the committee there was no representative of large areas of the north and west. The Chairman said it was most desirable that everyone should feel satisfied that the case was being satisfactorily presented, and although there might not be much in the contention for territorial representation on a body whose function was the collection and collation of evidence, it might be well to extend the membership to meet the objection raised. Dr. W. V. Howells (Swansea), Dr. Vaughan Jones (Leeds), and Dr. F. M. Rose (Preston) were accordingly added to the committee. A question was raised concerning the Highlands and Islands Medical Service, whether that should not have separate representation, but it was thought that the position would be met by asking representatives of that service to be among the first to present all the information they could to the committee.

The Evidence Committee has decided that a statistical inquiry be undertaken under the direction of Dr. A. Bradford Hill, Reader in Statistics at the University of London, to cover a large number—perhaps 5,000 or 6,000—general practitioners, selected at random, who will be asked to furnish particulars of their professional income and expenditure for three successive pre-war years. A report will then be prepared on the pre-war incomes of doctors of different ages in a variety of types of practice.

The question arose whether the expenditure on this statistical inquiry should be borne wholly by the National Insurance Defence Trust or in equal shares by the Trust and by the B.M.A. Although in the form in which the matter was first brought to the Insurance Acts Committee by officials of the Ministry the proposed Government inquiry referred to insurance practice specifically, the inquiry will be directed fundamentally to all questions of future remuneration, whether National Health Insurance as it is at present, National Health Insurance as extended, or the projected National Health Service. It was therefore agreed that the expenditure should be divided equally between the Trust and the Association, the Chairman remarking that if, as the matter proceeded, it became evident that the great advantage was with insurance practitioners as compared with those in other fields of general practice, a readjustment could be made.

The Treasurer of the Trust (Dr. J. W. Bone) reported that the income was suffering, though as yet to no marked degree, by the calling in of higher interest stocks and their replacement by investments carrying a lower interest. It was agreed to make a renewed appeal to panel areas which are backward in their contributions.

Following a resolution from the Hampshire Local Medical and Panel Committee, it was agreed to seek the advice of the Association's solicitor on the question whether, and if so how, the terms and constitution of the Trust could be amended in order to afford assistance to practitioners returning from active service to re-establish themselves in practice.

Question of Basic Salary

The committee devoted some time to a resolution, passed by a comparatively small majority at the Panel Conference at the instance of Surrey, requesting it to consider the desirability of practitioners entering the National Health Insurance Service being divided into three classes: those who desire to receive a full capitation fee for each State patient they accept, those who prefer to be remunerated by a basic salary and a reduced capitation fee, and a flying squad of practitioners who would receive a basic salary and be prepared to act as locumtenents. Dr. H. R. Cran, in bringing forward this proposal, said that it would make it possible for a practitioner to start in practice without having to put down a great deal of capital, and it would also assist a better distribution of practitioners.

The Chairman of Council (Dr. Dain) said that it would be a difficult thing to establish a service along these particular lines. Any method involving a salary would mean that the practitioner would be responsible to the person or body paying it, rather than to the patient. He had not yet seen any proposal for the payment of salaries to practitioners which succeeded in maintaining that aspect of the doctor–patient relationship. This, of course, would not prevent a group of doctors agreeing to work in a centre and accepting for that centre capitation fees proportional to the number of patients using it and dividing the payments among themselves. It was also well understood that there were certain special areas, such as the Highlands and Islands, where other considerations applied.

Other members thought that the proposal meant a partial acceptance of a State salaried service, which would run counter to previous resolutions. The Chairman said that the members of the Negotiating Committee would note the proposal and would bear in mind any elements of usefulness which it might contain.

Post-war Financial Assistance for Doctors

Dr. J. A. Brown, chairman of a joint subcommittee of the General Practice and Insurance Acts Committees which has been considering schemes for post-war financial assistance for doctors, brought forward a highly technical report on the subject; but it was stated that if approved, as it was, a statement more comprehensible by those not financially expert would be published and might be circulated to the younger members of the profession serving in the Forces. The subcommittee was asked to continue its work, and Dr. R. A. Forbes was added to its membership. One member suggested that the question of the doctor's house should be taken into consideration. "If you want to make a man bankrupt before he starts in life, require him to buy a house which the practice will not carry."

Dr. R. W. Cockshut said that the subcommittee was to be complimented on an able presentation, but it might now go further, and not merely work out schemes for financial assistance for these young practitioners on favourable terms but schemes whereby men who had had the fortune to be left at home and incidentally in most cases to make a certain amount of money might assist to the point of some sacrifice these younger men who had given up so much. It was agreed that the work of the subcommittee should be extended to cover this also.

Certification

As usual various matters relating to certification were on the agenda. The Isle of Wight again raised the question of the waste of time in giving monthly certificates to patients when a longer interval would do. The reply of the Ministry was that it would not be justified in allowing the issue of certificates for a period of three months but would be willing to amend the Certification Rules to allow more elasticity in the day of issue of special intermediate certificates. Dr. Howie Wood drew attention to a minute of the committee on April 20, 1944, in which it was stated that the Ministry had reminded the committee's representatives that it was always open to an approved society to use its discretion in individual cases, and had promised to explore the possibility of persuading approved societies to agree that in cases where a doctor wrote to the society asking for permission to issue special intermediate certificates at longer intervals than one month the request would be favourably considered. It was agreed that at the forthcoming meeting with the Ministry's representatives they should be reminded of this undertaking and pressed for something explicit on the subject. A number of other matters were referred to the representatives of the committee at their meeting with the Ministry, including the series of resolutions passed at the recent Panel Conference concerning sickness benefit in relation to pregnancy.

The arrangements whereby civilian doctors were to obtain assistance from Service medical officers in the event of an epidemic were referred to. It was stated that in one area at least this had not proved effective. The committee agreed to express its appreciation and thanks for the assistance received, but at the same time to ask for more.

The London Panel Committee raised the question of the issue of weekly war injury certificates. It was appreciated that probably the majority of doctors would give these certificates without charge even if they were entitled to make one, but the committee desired to know the precise position. At the beginning of the war the Association agreed to advise its members not to charge for these certificates, but it was not anticipated that they were going to be continuation certificates, nor that war injury certificates would include such things as injuries sustained at football. The generous gesture was not intended to cover the wide field which it had been made to cover since.

In spite of unusual travel difficulties there was a large attendance at the committee. One member, the representative for Inverness, Dr. W. J. Leach, apologized for his late arrival by explaining that he had been twenty-four hours in the train!

HOSPITALS' TRAINED NURSING STAFF

There is anxiety in hospital circles over the risk to the efficiency of the smaller hospitals and to the welfare of their patients which is implied in the direction of their trained nursing staff to E.M.S. and municipal hospitals by the Ministry of Labour. The National Advisory Council for Nurses seems to have agreed to a ratio of nine trained staff to 100 patients, and the Ministry of Labour is working to these figures. The Medical Board of the Rochdale Infirmary, in a statement of its own position, says:

> "This [ratio] means that in a hospital of 110 beds with a busy out-patient department either the nursing staff must be reduced to a level which means danger to acutely ill patients or the administrative staff must be reduced to a state of chaos. During the past year 2,160 operations were performed on in-patients at this hospital, so that at any one time at least one-third of the patients are acutely ill and require skilled attention. Under the above ratio we are allowed 10 trained staff. This must be divided as follows: 1 matron, 1 assistant matron, 1 sister tutor, 1 home sister, 3 ward sisters (for 4 wards), 1 theatre sister, 1 night sister, 1 casualty and out-patient sister. This means there are only 5 trained staff (3 ward sisters, theatre and night sisters) actually responsible for the nursing of 110 patients, at least 40 of whom have been operated upon in any one week; and this staff must presumably be on duty for 12 hours a day, as there are no staff nurses to replace them if they go off duty.
>
> "In the larger hospitals the number of trained staff essential for administration is not much greater than in a smaller one, and so a larger number of nurses are left for the actual nursing of patients; but even in these hospitals the numbers must be reduced to near the danger level, while the above figures undoubtedly show that in a 110-bed hospital the danger to patients is a very real one if this proportion of 9 trained staff to 100 beds is allowed to stand."

Correspondence

Ministry of Health and Radiology

SIR,—Your correspondent writing under the title "A.D.M.R." (*Supplement*, Feb. 3, p. 16) denies us the right to judge whether he is really qualified to answer Dr. Wigfield in the dictatorial manner he has. Has he made any contribution to the advancement of radiology or to the improvement in the status of the radiologist, other than his own? One would doubt it from the Nazi-like intolerance expressed in his letter.

Personally I believe Dr. Wigfield has a very just reason for calling the matter to the attention of radiologists. On reading the advertisement I wondered why radiology of all the specialist services should have been picked out for training, and why the Ministry's officials should be considered competent to judge of the worthiness of the applicant for the bounty. There are surely acute shortages in all spheres of activity to-day: no more in radiology than in any other. When the war is over we shall have good men enough and to spare who will be keen on radiology and anxious to serve it. Why clog up the specialty with subsidized "fillers" from the unfits or the E.M.S. and leave the more patriotic "builders" who are in the Services no chance on their demobilization to advance radiology.

The fact that a good initial financial inducement is offered to get house officers and unfits to sit for the examination is surely not all the reasons behind the choice of radiology at this time, and the possibilities of the future need some consideration. Though I have no "grievance, based on ignorance," as "A.D.M.R." expresses it, I have seen nothing in the memoranda issued in the radiological services of the Ministry of Health to induce me to persuade anyone to accept the dope offered.

I resigned my post at an E.M.S. hospital because I could get no support in checking the unnecessary waste from the ill-considered requests of inexperienced and undisciplined house officers.—I am, etc.,

Birmingham. JAMES F. BRAILSFORD.

Demobilization

SIR,—May I be permitted to suggest that, as at the present time there does not appear to be any constructive scheme for the demobilization of Service doctors except that which applies to all Service personnel, a scheme such as the one outlined by "Captain, R.A.M.C." (Jan. 13, p. 62), should be developed and strongly advocated by the Central Medical War Committee.

I think that five years in one of the Services is the maximum period that should be allowed, and at the end of this period the doctors in the Services and the E.M.S. should be interchanged. Apart from the existing scheme of age plus length of service other factors—such as a wife and children, ownership of a practice, the desire to specialize, etc.—should also play a large part in any demobilization scheme for doctors. I do not think it is expecting too much for a doctor of over 30, with a wife and children, five years' service in the Navy, and a desire to specialize, to long for his "bowler hat!" Like "Captain, R.A.M.C." I trust that I also may be forgiven for the prejudices apparent in this letter.—I am, etc.,

J. F. RAMSDEN.

Health Centres and General Practice

SIR,—Dr. S. Leff (*Supplement*, Jan. 27, p. 14) states that he cannot agree with the conclusions reached in my article (*Supplement*, Jan. 6, p. 1), but if Dr. Leff would refer to the article he must notice that it is fundamentally mathematical, and, therefore, the conclusions are wholly impersonal.

Far from disagreeing with the suggestion in his letter that if the chemists' shops were taken into consideration it would affect the conclusions, I would go so far as to suggest that he has probably supplied the main explanation for the difference of data between Zones A and D. Having gone so far in agreement, surely we can go the rest of the way and agree that the segregation of doctors in Health Centres by increasing the average inconvenience to patients will increase the numbers who will frequent the chemists' shops. This is of more than academic interest, for, while the segregation of doctors may not affect the mortality rate or the incidence of serious diseases, it will most certainly affect the "apparent" morbidity rate. This will lower the consumption of drugs at the Health Centres. It may even encourage some thoughtless official to draw invidious distinctions between Health Centres and single practitioners, giving credit where credit will be least due.

If the use of scientific methods cannot indicate to us how to be wise before some events, what is the good of employing them? If the Ministry of Health desires the maximum administrative control of general practitioners at minimum expense then it should segregate them. If, however, the Ministry's desire is to give maximum opportunity to develop some clinical knowledge of aetiology, the development of which is based, first, on a gift of friendship, and, secondly, on an analysis of the data of the sequence of events in many, many lives, the Ministry should see that general practitioners are scattered as widely as ever they can be. I do not write without evidence.

It would cloud the issue to reply to the other comments in Dr. Leff's letter. —I am, etc.,

Halifax. A. GARVIE.

A "Black Market" in Medical Practice

SIR,—You recently published a most challenging letter from Dr. F. M. Purcell (Dec. 30), and his gage does not, so far, appear to have been taken up. How, it may well be argued, can the development of a black market be envisaged in medical attendance? Are doctors more prone than other men to contract-breaking, and will they tend to seek undue increment by devious ways in breach of agreement freely entered into with the Government on behalf of the public, particularly after assurance that it is intended for the common weal?

The utter lack of indignant protest against this indictment is more than significant, unless we have come to place the utterances of Ministers in office upon a par with those of political candidates seeking election. The fallacy lies in supposing that the undertaking will be entered into freely; it will be imposed upon a majority much as were Government transactions with subjects in Stuart England and Hitlerite Germany. For at least a generation such compliance under duress (political or economic) is very likely to lead to black-market dealings and perhaps worse.

Inquiries conducted in every brief leisure moment merely confirm my long-felt suspicions that at least as many of the public as of the profession oppose the totalitarian medical service—that is to say, a majority. Modern bureaucracy is truly "a wonderful and a horrible thing," in the words of the Prophet. It might at first seem incredible that a numerically insignificant group of bureaucratic office-seekers could (and in the absence of unremitting opposition will) conclude between A and B a contract desired by neither of the parties, where A and B respectively represent millions and thousands of *far* more vitally important people than the contract promoters.

Equally staggering are some of the press comments. The *Times* may deem itself the official organ of Government, but rarely allows its consciousness of such high status to come between itself and its wits. Yet the leader of Jan. 9, 1945, reviewing the prolonged and active B.M.A. discussions, could only produce the fatuously trite and naïve comment: "The doctors do not seem to know what they want except to be left alone."

One of your correspondents has well said that the present medico-political dilemma results from the unfortunate dabbling in Socialism on the part of a largely Conservative Government. I fear that many medical men of the most Conservative persuasion will be a mite tempted at the next election to follow the advice of Dr. C. E. M. Joad and "vote Labour as the best of a rotten bunch."—I am, etc.,

Birmingham. PETER PARRY.

Towards Agreement

SIR,—Dr. Herman Mould (*Supplement*, Jan. 27, p. 14) considers that the ideal scheme of medical service can be obtained by "loyal co-operation" between the Government and the medical profession. Surely it follows that we must first secure an ideal Government and an ideal profession. If, moreover, "public respect and support" are to be our greatest safeguard in the future, the outlook is not rosy. We can honestly claim to have had both for many years, but they have not proved capable of persuading any Minister of Health to grant an adequate or reasonable panel fee. Are they likely to influence a Government determined to hoist a State medical service on the country with the public forbidden a voice in the matter? And can they influence any future Government, when the planners have obtained their final objective—the destruction of all personal freedom and liberty?

By all means let us co-operate in improving our health services to the utmost, but not in substituting totalitarianism for democracy.—I am, etc.,

Newnham. H. J. SELBY.

All Round the Clock

SIR,—May I submit a few notes on service "all round the clock." To-night, 11.15 p.m., open *B.M.J.*, read Dr. Saklatvala's letter. Decide member of noble profession (could have chosen something else), somewhat humbly go to bed. 12.15 a.m., telephone: "Urgent, haemorrhage; come at once, doctor." Crawl unwillingly out of bed. 12.45 a.m., arrive at house, find fat, cheerful, plethoric woman; "been flooding since yesterday morning, doctor, nearly sent last night; I'm a panel patient." Reassure fat woman; turn car in narrow lane, scrape wing. 1.5, arrive home, make oxo, no longer feel member of noble profession, but very disagreeable "put-on" G.P. Oh, Sir, an emergency squad as suggested by Dr. Hardy would suit me very well. Good night.—I am, etc.,

Burnley. HILDA SWINBURNE-JONES.

A maximum of six pairs of surgical rubber gloves is to be available during 1945 to doctors in private, general, or consulting practice who require them for professional use. A booklet of six certificates will be issued on application to the secretary of the Central Medical War Committee, B.M.A. House, Tavistock Square, W.C.1. Envelopes should be marked "Gloves" in the top left-hand corner, and a stamped addressed envelope should be enclosed for reply.

BRITISH MEDICAL ASSOCIATION

Election of Woman Member of Council

The following is the result of the election of a woman member of Council, 1944–5:

Barbara M. L. Abercromby (Liverpool)	140
Janet K. Aitken (London)	1,427*
Dorothy L. C. Day (Croydon)	68

* Elected.

No. of voting papers issued	3,826
No. returned	1,635
Spoiled papers	4

CHARLES HILL,
Secretary.

H.M. Forces Appointments

ARMY

War Subs. Major G. W. Bamber, R.A.M.C., to be a Consultant, G.H.Q., and has been granted the local rank of Brig.

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. C. L. Emmerson, having attained the age for retirement, is retained on the Active List supernumerary to establishment.

Major A. E. Campbell to be Lieut.-Col.

Capts. R. O. A. Leroux and R. E. Waterston to be Majors.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Capt. (War Subs. Major) W. S. C. Copeman, from Supplementary Reserve of Officers, to be Capt.

TERRITORIAL ARMY

Col. (Temp. Major-Gen.) Sir E. M. Cowell, K.B.E., C.B., D.S.O., T.D., K.H.S., R.A.M.C., has relinquished the temp. rank of Major-Gen.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs Lieut.-Col. (local Brig.) W. Anderson, O.B.E., has relinquished the local rank of Brig.

War Subs. Capts. R. M. A. Ormston and J. Sherne have relinquished their commissions on account of disability, and have been granted the honorary rank of Major.

War Subs. Capts. J. W. Smith, A. Henderson, W. R. Worsdell, B. Moore, P. H. Beamish, and H. Copeman have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

War Subs. Capt. G. A. Jones has been placed on the half-pay list on account of disability.

Lieut. D. W. Montgomery has relinquished his commission on account of disability, and has been granted the honorary rank of Lieut.

To be Lieuts.: D. Bell, C. H. Marshall, D. D. McCarthy, E. Taube, H. Trant, M.B.E., R. V. Bowles, W. O. Petrie, P. E. C. Manson-Bahr, G. E. Neville, G. C. Cochrane, J. W. Potter, L.-P. Ashton, H. Littna, T. Hughes, D. S. Dixon, A. Gellert, J. Dundas, N. D. Sanderson, R. Stewart, J. McK. Clark, K. S. Hocking, and H. Ehrlich.

POSTGRADUATE NEWS

The Fellowship of Medicine announces the following courses: (1) M.R.C.P. course in chest diseases at Brompton Hospital, Tues. and Thurs., 4.30 p.m., March 6 to 29. (2) Neurology at West End Hospital, Mons., Tues., and Fris., 2.30 p.m., March 2 to 27. (3) Anaesthetics at Radcliffe Infirmary, Oxford, all day, March 5 to 17. (4) Anaesthetics at various London hospitals, all day, April 9 to 21. (5) Week-end course in rheumatism at St. Stephen's Hospital, all day, Sat. and Sun., March 24 and 25. (6) Week-end courses in obstetrics at West Middlesex County Hospital, all day, Sat. and Sun., March 3 and 4. (7) Final F.R.C.S. clinical courses as follows: Metropolitan Hospital, Weds., March 7, 21, and April 18, 5.30 p.m.; London Homoeopathic Hospital, Weds., March 14, 21, 28, and April 4, 11, and 18, 5.30 p.m.; St. Mary Islington and Archway Hospitals, Weds., March 21 and 28, Tues., April 3, and Wed., April 11, at 2 p.m.; Hillingdon County Hospital, week-end course, Sat. and Sun., April 14 and 15; London Homoeopathic Hospital, Sat., April 21, 2.30 p.m.

WEEKLY POSTGRADUATE DIARY

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m., Dr. R. Aitken: Some Unusual Forms of Dermatitis.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—Lectures on Applied Physiology by Prof. John Beattie: *Mon.*, 2.30 p.m., Experimental Shock. *Wed.*, 2.30 p.m., The Physiological Effects of Burns. *Fri.*, 2.30 p.m., The Physiological Effects of Obstructions of the Alimentary Canal. Lectures on Anatomy by Prof. A. J. E. Cave: *Mon.*, 4 p.m., The Skin and its Appendages. *Wed.*, 4 p.m., The Subcutaneous and Subserous Tissues. *Fri.*, 4 p.m., The Fasciae.

ROYAL SOCIETY OF MEDICINE.—*Tues.*, 4.30 p.m., Section of Pathology. *Wed.*, 2 p.m., Section of Comparative Medicine. *Thurs.*, 5 p.m., Section of Urology. *Fri.*, 4.30 p.m., Section of Disease in Children; 3 p.m., Section of Epidemiology and State Medicine.

CHADWICK LECTURE.—At Royal Society of Tropical Medicine and Hygiene, 26, Portland Place, W.—*Tues.*, 2.30 p.m., Dr. J. D. Rolleston: The War and Infectious Disease.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, W.—*Wed.*, 3.30 p.m., Dr. I. H. Maclean: The Problem of Whooping-cough Immunization.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. *This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.*

BIRTHS

ACKNER.—On Feb. 8, 1945, in London, to the wife of Fl. Lieut. Brian Ackner, R.A.F.V.R., a daughter.

JONES.—On Jan. 22, 1945, at Llanelly, to Edna (*née* Jenkins), wife of Dr. Donald S. Jones, a son—Peter Sydney.

KELVIN.—On Jan. 31, 1945, at the London Hospital, to Pauline (*née* Okun), wife of Capt. Richard Kelvin, R.A.M.C., B.L.A., a daughter—Patricia Mavis.

MINETT.—On Jan. 11, 1945, at the London Clinic, Devonshire Place, to Mary (*née* Bull), wife of Dr. Jack Minett, Colonial Medical Service, a daughter.

SWINTON.—On Feb. 4, 1945, at Mayday Hospital, Croydon, to Marjorie (*née* Johnson), wife of Charles F. Swinton, Ch.M., F.R.C.S.Ed., a daughter.

MARRIAGE

JACKSON—MARTIN.—On Jan. 24, 1945, at St. Cyprian's, Marylebone, Gerald Christopher Arden Jackson, D.Sc., M.B., B.S., Capt., R.A.M.C., youngest son of the late Dr. and Mrs. M. J. Jackson, and Mary Honor Martin, Jnr. Cmdr., A.T.S., younger daughter of Dr. and Mrs. R. H. Martin, of Clanrye, Sudbury.

DEATHS

BUTLER.—On Jan. 29, 1945, at his residence in Hampton-in-Arden, Thomas Harrison Butler, D.M.Oxon, F.R.C.S., A.M.I.N.A., in his 74th year.

CARMALT.—On Jan. 26, 1945, suddenly, after a gallant fight against ill-health, Hugh Edward Carmalt, *M.C.*, aged 39, M.O. to 7th Royal Warwicks, 1939-41, and in practice in Handsworth, Birmingham, before the war, dear husband of Dorothy Carmalt, 3, Sandwell Road, Birmingham, 21.

COGAN.—On Jan. 24, 1945, at Wellclose, Chapel-en-le-Frith, Dr. Denis Cogan, dearly loved husband of Lily (*née* Farnon).—*R.I.P.*

LLOYD.—On Jan. 31, 1945, at 45, Kilworth Avenue, Southend-on-Sea, Edmund Eyre Lloyd, M.R.C.S., L.R.C.P., elder son of the late Deputy Surg.-Gen. Edmund Eyre Lloyd, Madras Medical Service, aged 72.

STAMBERG.—On Aug. 19, 1944, in Jersey, C.I., Arthur Clement Stamberg, O.B.E., M.B., C.M.Ed., D.C.M.S., Ministry of Pensions, Channel Isles area, member British Institute of Radiology and Ophthalmological Society, late Lieut.-Col. R.A.M.C., very dearly loved husband of Mary A. D. Stamberg.

WILSON.—On Jan. 31, 1945, at the Gables, Winterton, Sedgefield, George Shepherd, M.B., Ch.B., D.P.M., Medical Superintendent of the Durham County Mental Hospital, youngest son of the late William Wilson, Greenock, and beloved husband of Nancy Tarbet of Gourock. Deeply mourned.

RETURN TO PRACTICE

The Central Medical War Committee announces that Mr. J. Sherne, F.R.C.S., has resumed civilian practice at 43, Park Square, Leeds, 1. Dr. Sydney Tibbles is also practising again at 2, Harley Street, W.1.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY FEBRUARY 24 1945

HEARD AT HEADQUARTERS

he following notes on B.M.A. activities ave been contributed by a detached but formed observer.

Merely Ignorance

The ignorance which some non-mem- rs of the Association display concern- g its work is almost beyond belief. And hen upon such ignorance is based pre- sterous criticism, no wonder there are y faces in Tavistock Square. I was own a letter from a doctor who, in turning the application form for mem- rship and saying that he had no use r it, delivered himself thus:

> " In any case many members could see, me ten years ago, that it was, even at at time, an urgent matter for the Asso- ation to formulate some sort of policy wards the future of medicine on be- lf of the patient, the public, the physi- an, and the State without waiting until e Government should find it necessary drag it [the Association] by the ears this work."

Of course, we have all been mistaken. he B.M.A., contrary to what we had ought, never issued in 1929 its memor- dum on a General Medical Service for e Nation. It never reissued it in 1938. never appointed the Medical Planning mmission. For twenty years it never ld meetings or passed resolutions or mulated reports urging upon the overnment the need for a reorganiza- n of medical services. These things a mere dream. Not until 1942, when Government, wide awake to the pros- ct of post-war reconstruction, began to erest itself in medical planning did the M.A. itself wake up.

What backwoods some men live in!

Medical Witnesses

The law's delays are notorious and ect medical witnesses among other ople. One practitioner told me the her day that he had been warned to end at the Central Criminal Court, but date or hour could be fixed, and he uld receive a further summons when attendance would be required forth- th. Meanwhile, of course, he can ke no firm engagement lest he be lty of contempt of court.

These delays cannot be helped until re is a drastic reform of legal pro- dure. Meanwhile Headquarters is ing up with the appropriate Depart- nt the question of fees for medical nesses. A 50% increase in such fees s made during the last war, but since n they have remained stationary. It felt that the time has come for a per- nent, not merely a temporary, increase. e minimum suggested is 1½ guineas for half-day attendance at magistrates' courts and 3 guineas for a whole day, and 3 and 5 guineas respectively for attendance at sessions and criminal courts.

The reason for the discrimination between the two kinds of courts is obvious. Attendance at sessions or criminal courts is much more time-consuming. At magistrates' courts offenders are dealt with more expeditiously; the doctor also can generally learn the time at which his case is likely to come on, and receive release directly he has given his evidence. At some criminal courts he may be left waiting about for days.

Evidence of Incapacity

In some industrial districts there is criticism of the new certificate form E.D.652. The form was prepared with a great deal of care by the Association, and was approved by the Minister of Labour, though there is no obligation on doctors to use it. Representatives of the North of England Branch, which in particular has taken exception to the form on certain grounds, met the General Practice Committee on the subject recently. Some certification difficulties were ironed out in the course of a long conversation, but industrial certification is a big question with many sides to it.

One ground on which the Branch took exception to the certificate was that on the reverse it provides for a statement that the patient "informs me that from (date) to (date) he has been suffering from . . . .", and it goes on to declare that he is now fit for work or that an independent examination is recommended. It was argued that the patient who had been away from work for a day or two might put down bronchitis or rheumatism or any malady he fancied, and the doctor, while not indeed certifying to the correctness of the diagnosis, would be the means of transmitting it, and might be considered to be guilty of loose certification.

Still, it is as plain as words can make it that it is the patient's information, and there is no endorsement of it, expressed or implied, by the practitioner. A good deal seems to turn upon the trustworthiness of the average industrial patient. No doubt there are some who will offer any excuse for a short absence from work, and perhaps will be more inclined to give it to the neutral doctor than to their sceptical employer or foreman. But the testimony of one member of the General Practice Committee with a considerable industrial practice was reassuring on the point. In his experience 99% of the workpeople in such cases are trustworthy. They do not call in a doctor for a minor illness of very short duration because they do not want to trouble him, and their statements as to what their condition on preceding days has been, if not always accurate, are at all events honest.

In any case the point was strongly made that the doctor's part in certification is not that of a detective.

A Concession

A useful concession has been made in the fees payable for medical examinations for posts in Civil Service Departments generally, including the Post Office. Sir Henry Bashford, medical adviser to the Treasury, in a communication to the Association, states that some years ago a fee, fixed at 15s., was arranged to be paid to Post Office local medical officers when asked to examine Post Office employees for suitable positions. In the case of boys and girls in the Post Office a similar earlier examination was made on first employment, and if the same doctor carried out both examinations, the fee was held to cover both—never a very satisfactory arrangement. It has now been agreed that the fee shall be paid for each examination, whatever doctor does it, in all cases.

Moreover, the Civil Service Commissioners have also been working on a 15s. basis for establishments in Civil Service Departments generally, and the Treasury has now agreed that the fee shall be raised to one guinea, applying to the Civil Service as a whole, including the Post Office cases just mentioned.

Weatherproof

Neither " blitzes " nor blizzards seem seriously to interfere with the attendance at central committees and subcommittees. The members turn up from all parts of the country, including the far north and far west, in all sorts of weather, sometimes with an apology for late trains, and with a wary eye on the clocks as the late afternoon wears on. But they come undeterred by the discomforts and uncertainties of winter travel, and they go through the business with a conscientious zest which, as one watches it, explains the strength of an Association which can enlist such unselfish service.

The other day, at a meeting of the General Practice Committee, while a snowstorm swept London and the Provinces, thirteen members out of a possible twenty turned up, and Scotland, Lancashire, and the Midlands, not to speak of the Home Counties, were all represented.

FROM THE PRESS CUTTINGS

" We were told, some time ago, that no controversial legislation would be introduced until the enemies of liberty were beaten. But invasions of liberty are occurring on every side . . . and, shortly, we may not even be able to choose our own doctors, but be compelled to have our pulses felt by bureaucratic hirelings with safe jobs and, after a year or two, peaked caps like tram-conductors."—Sir John Squire in *Illustrated London News.*

" It is hardly logical for the State to provide a health service for people at home and to ignore them while they are at work, or, if a national industrial health service is set up, to make it responsible to a different Government Department."—From the *Economist.*

MEDICAL WAR RELIEF FUND

FOURTH ANNUAL REPORT

This report covers the twelve months from Sept. 1, 1943, to Aug. 31, 1944. Dr. H. Guy Dain has succeeded Mr. H. S. Souttar as chairman of the committee of the Fund. Mr. Souttar ceased to be a member of the committee on resigning the chairmanship of the B.M.A. Council, but retains his membership of the Distribution Subcommittee. Dr. J. W. Bone has been appointed honorary treasurer in place of the late Dr. G. C. Anderson. Sir Hugh Lett has continued to act as chairman of the Distribution Subcommittee, and Mr. Zachary Cope was appointed chairman of the Prisoners-of-War Subcommittee.

During the period under review financial assistance was given to thirty-five applicants—nine more than in the previous year. A number of typical cases are summarized below. The total number of beneficiaries—some of whom have received more than one award—is now 113. As in former years, substantial assistance has been obtained for a number of applicants from other benevolent funds, including the Lord Mayor's National Air-Raid Distress Fund, the Far Eastern Relief Fund, the Officers' Association, the Officers' Families Fund, the Royal Air Force Benevolent Fund, and the Royal Medical Foundation of Epsom College. On the advice of the Distribution Subcommittee several applicants have applied for and received war service grants.

Financial Position

For the first time since the inauguration of the Fund the amount distributed in gifts and loans exceeded the amount of the contributions received during the year, but as there is still a substantial balance in hand the committee does not think it necessary at present to repeat the appeal for subscriptions which it made four years ago. It welcomes the spontaneous flow of subscriptions which is still continuing, and it is confident that a generous response will be given by the profession to a renewed appeal if this should prove necessary in the future. In former reports reference has been made to the magnificent support received from members of the profession in various parts of the Empire over-seas, and the committee again wishes to record its appreciation of their splendid help and, in particular, of further generous donations from doctors in Canada, which have brought the total sum contributed through the Canadian Medical Association to a figure exceeding £2,500.

Books for Prisoners-of-War

A subsidiary activity of the Fund is the provision of medical books required by British doctors who are prisoners-of-war. A special subcommittee has carried out this work in co-operation with the Educational Books Section of the Red Cross and St. John Prisoners-of-War Department. Books selected by the subcommittee are purchased and dispatched by the E.B.S., the cost being refunded to this organization. This arrangement has two important advantages. First, parcels of books sent by the E.B.S. bear the Red Cross label, which receives priority, and the books therefore arrive sooner than they would if sent by a bookseller. Secondly, the E.B.S. maintains a stock of medical books at Geneva, and the time taken in transit is greatly shortened when a request from a prisoner-of-war can be met by ordering volumes included in the "Geneva Reserve." During the year, 112 books were ordered for dispatch to twenty-five different camps and hospitals, the cost incurred being approximately £150. Only sums specially marked by subscribers for the purpose are used for the purchase of books.

Acknowledgments

Once again the committee of the Fund acknowledges its special indebtedness to the Royal Medical Benevolent Fund for its invaluable help, particularly in administering awards payable in instalments over a period of years. Grateful thanks are due also to the British Medical Association for its continued assistance, including the provision of accommodation for meetings; to the Red Cross and St. John Educational Books Section for most valuable co-operation; to Messrs. Price, Waterhouse and Company, who have generously given their services as honorary auditors; and to Mr. E. C. Pennefather, honorary secretary of the Distribution Subcommittee, to whom the Fund is much indebted for the resourcefulness with which he secures the co-operation of other organizations, and the tact and understanding shown in his correspondence with applicants.

Address for Subscriptions

Subscribers are asked to make their cheques payable to the Medical War Relief Fund and to send them to the Honorary Treasurer of the Fund at B.M.A. House, Tavistock Square, London, W.C.1. When a subscriber wishes his contribution to be used for the purchase of books for medical prisoners-of-war, this should be clearly stated.

APPENDIX I

Some Typical Cases

Dr. G. had volunteered for service with the Forces in 1939, leaving a successful practice which, being situated in a much-bombed London district, had declined very seriously during his absence. His own house had been bombed and, with a greatly decreased income, he had been obliged to face the expenditure involved in arranging accommodation for his family in the country. He had not been able to keep up the payments of interest on a loan negotiated in connexion with the purchase of his practice, and considerable arrears had accumulated. The pressure exerted on him by the insurance company was causing him great anxiety, which was relieved by the award of a substantial gift from the Fund.

Dr. H., who had practised also in an area which was largely destroyed by bombing, died prematurely after a period of most arduous work in the London "blitz." His house was rendered uninhabitable, and what remained of his practice was unsaleable. His widow required help, particularly for the education of her children. She was awarded a suitable gift to supplement a grant received, through the Medical War Relief Fund, from the Lord Mayor's National Air-Raid Distress Fund.

Dr. I. was killed while serving in the R.A.M.C. His widow hoped to obtain remunerative employment but needed temporary assistance in meeting educational expenses. The necessary provision was made by the Fund in co-operation with the Officers' Association.

Dr. K. had relinquished his commission in the R.A.M.C. on medical grounds after serving for more than three years. His practice, which was largely private and included only a small number of insured patients, had suffered seriously during his absence, and it had been necessary to use all his capital to defray the family expenses. He was given assistance, partly in the form of a loan, to tide him over the difficult period of re-establishing himself in civilian practice.

Dr. L., a serving officer, had been reported missing, and the education of his three young children presented a financial problem. One child was awarded a scholarship at a public school, and the additional assistance required was provided as a gift from the Fund.

Dr. M., a young married doctor with no children, was killed in action while serving in the R.A.M.C. The pension received by his widow was insufficient to cover both the cost of her maintenance and the expenses of a professional course of training which she was anxious to undertake and for which she appeared well fitted. She requested a comparatively modest sum annually for a period of years to enable her to pay the tuition fees. The Medical War Relief Fund and the Officers' Families Fund shared the responsibility of providing the necessary amount in yearly instalments.

APPENDIX II

STATEMENT OF ACCOUNT FOR TWELVE MONTHS ENDED AUGUST 31, 1944

No. 1 Account (Relief of Financial Distress)

	£	s.	d.	£	s.	d
To Balance brought forward:						
£7,000 3% National Savings Bonds, 1955–65..........	7,000	0	0

MATERNITY SERVICES IN SCOTLAND

REVISED TERMS FOR DOCTORS

All the main recommendations of the Scottish Committee of the B.M.A. for revised terms of service for doctors under the Maternity Services (Scotland) Act have, after continued pressure, been accepted by the Department of Health, which has asked local authorities to adopt them. The following are the revised terms:

Doctors' Basic Fees

1. For all antenatal, intranatal, and post-puerperal services rendered by a doctor in terms of a scheme, including services rendered to any patient who, after labour has begun, is removed to hospital or who dies, a fee of £3 3s. will be paid.

2. For all services rendered to any patient who is removed to hospital before labour has begun and is confined in hospital or who dies before labour starts the fee will be £1 5s.

3. (*a*). When the patient moves to another area before labour starts the fee payable for the services specified in (1) above will be 15s. to the doctor in the area from which she has removed and £2 8s. to the doctor in the new area to which she has gone. (*b*) The £2 8s. will be payable where the patient after change of residence is removed to hospital or dies after labour starts. Where the patient after change of residence is removed to hospital before labour begins and is confined in hospital or dies before labour begins the fee will be 15s.

These fees will be payable in any case where a pregnancy for which a midwife and a doctor have rendered any antenatal services terminates in abortion or miscarriage, as if the patient had been confined at the time of the abortion or miscarriage. There will be no differentiation in the fees paid for patients entitled to medical benefit under the National Health Insurance Acts.

Other Agreed Items

Mileage payments are to be increased *as a wartime measure* by 10%, such addition to be payable with the increased fees in respect of confinements occurring on and after April 1, 1944. In future doctors may submit the completed record form to the local authority within three months of confinement, not two as before. The term "labour" may be defined as the period from the onset of the first pain until the final stage, including repair of the perineum, if repair is necessary and done immediately.

In a letter to Branches and Divisions of the B.M.A. and to Panel Committees in Scotland, Dr. R. W. Craig, Scottish Secretary, says it is hoped that in view of the substantially improved terms of service those doctors who have so far not been willing to undertake the work under the schemes of local authorities will now be prepared to do so and will do their best to make the service as effective as possible.

STANDARDS OF REMUNERATION FOR GENERAL PRACTITIONERS

The full personnel of the committee set up by the Minister of Health and the Secretary of State for Scotland to inquire into the proper standards of remuneration for general practitioners in publicly remunerated practice is now announced. It will be remembered that as long ago as last August (*Supplement*, Sept. 16, p. 60) the Insurance Acts and the General Practice Committees of the B.M.A. met jointly to consider the merits and procedure of the proposed inquiry and elected three of the four medical members (the fourth had then to be nominated by Scotland).

The members of the committee as now announced are: Sir Will Spens (chairman), Master of Corpus Christi College, Cambridge; Dr. J. A. Brown, Birmingham; Dr. O. C. Carter, Bournemouth; Mr. E. Davies, solicitor, London; Sir Ernest Fass, former Public Trustee; Dr. W. M. Knox, Glasgow; Mr. T. Lister, accountant, London; Mr. J. L. Smyth, secretary, Social Insurance Department, T.U.C.; and Dr. S. A. Winstanley, Urmston, Lancs. The joint secretaries are Mr. H. F. Summers, Ministry of Health, and Dr. A. V. Kelynack, Assistant Secretary, B.M.A. The terms of reference are as follows: "To consider, after obtaining whatever information and evidence it thinks fit, what ought to be the range of total professional income of a registered medical practitioner in any publicly organized service of general medical practice; to consider this with due regard to what have been the normal financial expectations of general medical practice in the past, and to the desirability of maintaining in the future the proper social and economic status of general medical practice and its power to attract a suitable type of recruit to the profession; and to make recommendations."

Correspondence

The Ministry of Health and Radiology

SIR,—I am indebted to "A.D.M.R." (*Supplement*, Feb. 3, p. 16) for his seemingly authoritative correction of my false premisses, and hasten to offer my apologies through him to the Ministry of Health. No apology would have been necessary, nor indeed would criticism have been occasioned, had the Ministry or its adviser been less reckless in framing the advertisement which led to my outburst.

The advertisement clearly and definitely referred to "the examination," which, by common usage, means "the examination," and not, as now claimed by "A.D.M.R.," any examination for a diploma in medical radiology granted by the University of London, the Conjoint Board, or any Provincial university which may grant a diploma, and of whose existence "A.D.M.R." claims as much ignorance as that which he ascribes to me. Secondly, the advertisement stipulates the terms upon which "successful candidates" will be enrolled in the E.M.S. I would point out to "A.D.M.R." that "successful candidates," by common usage, means "successful candidates" and not, as he is at pains now to show, "selected applicants."

I refrain from discussing the merits of a State subsidy for medical education, even though the present expedient may be merely necessary as a counter to the machinations of the Ministry of Labour. However, at the "instigation" of the Ministry of Health a precedent has been established. Yet I dare to hope that many besides myself consider that any achievement, if worth while, merits personal sacrifice and individual endeavour. —I am, etc.,

Watton-at-Stone. MAURICE WIGFIELD.

General Practice and the Time Factor

SIR,—In the White Paper itself and in all the various articles about it, in both medical and lay press, I have never seen any mention of the time factor in connexion with general practice. It is always classed simply as general practice without any effort to differentiate between the very wide extremes contained within it.

It is the avowed intention of the Government and undoubtedly the desire of the medical profession to provide the public with the best possible medical attention. The arguments and differences of opinion, about which we hear so much, are not concerned with this common aim, but with the means of achieving it. There is no doubt that the great majority of the public are of the opinion that the panel patient does not get the same treatment as the private patient who is paying a comparatively high fee, and in many cases they prefer to pay a fee rather than avail themselves of the service to which they are entitled.

So far as I can see there are four factors that can affect the differences between the extremes of general practice: they are the doctor, the appliances, the drugs, and the time spent on each case. The first three of these are the same for all practical purposes throughout general practice, but the time factor varies through a very wide range. I am quite sure that the majority of the public do not realize this. They take it for granted that the doctor who charges 10s. 6d. earns three times as large an income as the one who charges 3s. 6d., whereas the profession knows that the average earnings of general practitioners do not vary greatly, because the one who charges 10s. 6d. spends three times as long over each case and sees approximately one-third of the number of patients per day. In other words, the doctor with time charges more, or the doctor who charges more has time. It is immaterial which way we put it. I wonder to what extent the politicians who are planning the future of medicine for us realize this. I believe that they intend to produce for the public one type of general practitioner service, and don't know the reason why they produce the other type, or perhaps they deliberately avoid the point on account of the extra cost.—I am, etc.,

Plymouth. A. R. WALKER.

"Public" Medical Care under N.H.S.

SIR,—One of the problems of a State Medical Service will be the treatment of those folk of refined and retiring natures to whom the publicity of the waiting-room or clinic will be a deterrent to proper attention. There are many who would rather die than enter the public ward of a hospital, and this from no snobbish motives: they are just made that way. I have to-day received a letter from a patient (a solicitor in county council employment), and he makes the somewhat novel suggestion that where the illness or disability is so trivial as to render visits unnecessary a small fee should be paid at the time by the patient who desires this luxury. He also suggests a supplementary fee for a private bed in a hospital where the patient is willing to pay for the privilege.

The suggestion is not really as novel as it seems. Harris and Sack, in their book *Medical Insurance Practice* (p. 163), consider that if a panel patient requires visiting purely for his own convenience where he should normally attend the surgery he might be legally charged a fee for the visit. Without expressing any personal opinions on the matter, I think this letter from my solicitor friend is worth quoting as expressing the views of many of the middle and professional classes who would welcome State assistance towards their medical expenses, but who would also be glad to pay supplementary fees for the amenities to which they have always been accustomed.

I know that the system would raise an outcry against "class distinction," but unless legislation is purposed to abolish class distinction it would seem that there will still be sections of our community separated from each other by cultural and financial gulfs until the millennium arrives, when we shall all be levelled down to one plastic homogeneous mass.—I am, etc.,

Tiverton. JOHN V. MAINPRISE.

Medical Planning in Australia

SIR,—As one of the representatives on the Council of two of the Australian Branches of the B.M.A. will you permit me to thank you for so lucidly putting before your readers the comparable difficulties now simultaneously confronting the medical profession both here and over-seas. I feel sure my constituents will appreciate the fact that in the midst of our own problems we have not forgotten theirs. It is as true in 1945 as it was in 1776 that "we must all hang together or assuredly we shall all hang separately."—I am, etc.,

Ormskirk. RICHARD J. A. BERRY.

H.M. Forces Appointments

ARMY

Col. J. G. Gill. C.B.E., D.S.O., M.C., late R.A.M.C., to be a D.D.M.S., and has been re-granted the temp. rank of Major-Gen.

War Subs. Major E. E. Prebble, R.A.M.C., to be a Consultant, and has been granted the local rank of Brig.

ROYAL ARMY MEDICAL CORPS

Short Service Commission.—Lieut. (War Subs. Capt.) J. M. La Ferla, from Emergency Commission (Malta Section), to be Lieut. and to be Capt.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Capt. (War Subs. Major) W. E. Underwood, O.B.E., from Supplementary Reserve of Officers, to be Capt.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. J. Rickman has relinquished his commission on account of disability, and has been granted the honorary rank of Major.

War Subs. Capts. N. L. Probert, G. A. Jones, and M. J. Hilton have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

Lieut. M. Libman has relinquished his commission on account of disability, and has been granted the honorary rank of Lieut.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

War Subs. Capts. (Mrs.) H. I. Goodall and H. M. D. Gilbert have relinquished their commissions.

War Subs. Capt. (Mrs.) M. J. Morgan has relinquished her commission on account of disability.

ROYAL AIR FORCE

Flying Officer H. N. H. Genese to be Fl. Lieut.

RESERVE OF AIR FORCE OFFICERS

Squad. Ldrs. (Temp.) G. James and H. L. Jenkins have been granted the rank of War Subs. Squad. Ldr.

ROYAL AIR FORCE VOLUNTEER RESERVE

Fl. Lieut. E. H. Jones has resigned his commission, retaining the rank of Squad. Ldr.

Flying Officer R. C. Howard to be War Subs. Fl. Lieut.

INDIAN MEDICAL SERVICE

Col. G Covell, C.I.E., K.H.P., to be Major-Gen.
Lieut.-Col. D. V. O'Malley, O.B.E., to be Col.
Lieut.-Col. T. S. Shastry has retired.

EMERGENCY COMMISSIONS

Capts. (Mrs.) B. F. Dickinson, E. M. Bowles, and L. M. Corall have resigned their commissions, and have been granted the honorary rank of Capt.

COLONIAL MEDICAL SERVICE

The following appointments have been announced: E. S Sutherland, L.R.C.P., L.R C.S., Assistant Medical Officer, Jamaica; C. H. Howat, F.R.C.S., Senior Medical Officer (Surgeon Specialist), Cyprus; G. Louw, M.B., Ch.B., Senior Medical Officer, Uganda; N. M. Maclennan, M.D., D.P.H., Director of Medical Services Kenya; B. O. Wilkin, M.B., Ch.B., D.P.H., Senior Medical Officer, Tanganyika.

Mr. H. N. Linstead, secretary of the Pharmaceutical Society, speaking at Aberdeen, Glasgow, and Edinburgh recently, said that the chances of the Government's proposals for a National Health Service being put into effect were substantial, but he thought the service would not be organized and ready to operate before 1948 at the earliest. We could afford this scheme, certainly for the first post-war years, for which alone we could at present provide with any certainty. If the scheme was to be universal substantially more than twice the present number of National Health Insurance patients would be embraced in it; he hoped the £420 income limit would be abolished. If the service was to be universal eventually, it should be universal from the beginning. If there was a shortage of doctors all should suffer from it equally. It would go far to destroy confidence in the new service if there remained a large number of the population paying for the service and suspected by the remainder to be getting something far better. One would hope that no attempt would be made to give a new lease of life to the National Health Insurance service, which could not be adapted to provide for even the minimum needs of another 20 million or more people. He was in favour of the type of health centre recommended by Lord Dawson's committee after the last war, where the patient was sent by the family doctor for further examination, for consultation with the specialist, and for minor surgery. The private consulting-room would remain as the normal meeting-place of the doctor and the patient.

POSTGRADUATE NEWS

The Fellowship of Medicine announces the following courses: (1) Neurology (suitable M.R.C.P.), at West End Hospital, Mons., Tues., and Fris., 2.30 p.m., from March 2 to 27. (2) Anaesthetics, at Radcliffe Infirmary, Oxford, all day, March 5 to 17. (3) Anaesthetics, various London hospitals, all day, April 9 to 21. (4) Rheumatism, week-end course at St. Stephen's Hospital, all day, Sat. and Sun., March 24 and 25. (5) Final F.R.C.S. clinical courses as follows: Metropolitan Hospital, Weds., 5 p.m. March 7 and 21, and April 18; London Homoeopathic Hospital, Weds., 5.30 p.m., March 14, 21, 28, and April 11 and 18; St. Mary Islington and Archway Hospitals, 2 p.m., on Weds., March 21 and 28, Tues., April 3, and Wed., April 11; Hillingdon County Hospital, week-end course, Sat. and Sun., April 14 and 15; London Homoeopathic Hospital, Sat., April 21, 2,30 p.m.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*West End Hospital for Nervous Diseases:* Mon., Tues., Fri., 2.30 p.m., course in neurology (suitable M.R.C.P.). *West Middlesex County Hospital:* Sat. and Sun., March 3 and 4, all day, week-end course in obstetrics.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—Lectures on Applied Physiology by Prof. John Beattie: *Mon.*, 2.30 p.m., Rationale of Fluid Therapy; *Wed.*, 2.30 p.m., Kidney Function; *Fri.*, 2.30 p.m., Handling of Bad Surgical Risks (Diabetics, Nephritis, etc.). Lectures on Anatomy by Prof. A. J. E. Cave: *Mon.*, 4 p.m., The So-called Pelvic Fascia; *Wed.*, 4 p.m., Morphology and Classification of Joints; *Fri.*, 4 p.m., Growth Regions of the Skeleton.

ROYAL SOCIETY OF MEDICINE.—*Mon.*, 4.30 p.m., Section of Odontology. *Tues.*, 4.30 p.m., Section of Medicine. *Thurs.*, 4.30 p.m., Section of Neurology. *Fri.*, 10.30 a.m., Section of Otology; 2.30 p.m., Section of Anaesthetics; 2.30 p.m., Section of Laryngology.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, W.—*Wed.*, 3.30 p.m., Dr. Harold Balme: The Place of Rehabilitation in Hospital Service.

B.M.A.: Branch and Division Meetings to be Held

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle-upon-Tyne, Thursday, March 1, 2.15 p.m., Clinical Demonstration in the out-patient department by Dr. A. A. McI. Nicol and Mr. W. A. Hewitson. 3.45 p.m., Address by Major-Gen. W. H. Ogilvie: Application of Lessons of War to Surgery of Peace. Members of H.M. Forces stationed in the area are invited.

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Shrewsbury, Tuesday, March 6, 3.30 p.m., Demonstration of cases recently treated by penicillin. Members of H.M. Forces are invited.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue

BIRTHS

ALDRIDGE.—On Feb. 14, 1945, at Worcester, to Hilda (*née* Jennings), wife of Acting Squad. Ldr. L. W. Aldridge, R.A.F.V.R., a daughter.

SMART.—On Feb. 16, 1945, at Ipswich, to Ann, wife of Mr. Graham Smart, a son—Robert James.

MARRIAGES

COATES—GATENBY.—On Feb. 1, 1945, at the Garrison Church, Deolali, India, by the Rev. J. F. W. Ruddell, Major John Clapham Coates, R.A.M.C., son of Mr. and Mrs. A. Coates, of Keighley, and Assistant Matron Margaret Hildreth Gatenby, T.A.N.S., daughter of Mr. and Mrs. R. S. Gatenby, of Bridlington.

PATTISON—ANDREWS.—On Jan. 5, 1945, at St Peter's Church, Colombo, Peter Pattison, Surg Lieut., R.N.V.R., son of Dr. and Mrs. C. Lee Pattison, King Edward Hospital, Sheffield, to Third Officer Mary Andrews, W.R.N.S., daughter of Mr. and Mrs. C. F. Andrews, of the Mendips, Gibb's Road, Newport, Mon.

DEATH

MARSHALL.—On Feb. 13, 1945, at Parvey Lodge, near Macclesfield, Herbert Frank Marshall, M.R.C.S., L.R.C.P., F.R.C.S.Ed., beloved husband of Christian (*née* Haig Ferguson).

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY MARCH 3 1945

HEARD AT HEADQUARTERS

The Negotiating Committee

The discussions between the Negotiating Committee and the Ministry of Health have now continued for several weeks, and it is expected that the B.M.A. members on the committee will report to a special meeting of the Council on March 21 Readers may like to be reminded of the membership of the committee. It is as follows :

16 Representatives of the British Medical Association

Viscount Dawson of Penn, London.
Dr. H. Guy Dain, Birmingham.
Dr. J. C. Arthur, Low Fell, Co. Durham.
Dr. P. Martin Brodie, Edinburgh.
Dr. J. A. Brown, Birmingham.
Dr. R. W. Cockshut, London.
Dr. F. Gray, London.
Dr. E. A. Gregg, London,
Dr. J. A. L. Vaughan Jones, Leeds.
Dr. J. F. Lambie, Glasgow.
Dr. J. B. Miller, Bishopbriggs, Lanarks.
Mr. R. L. Newell, Manchester.
Dr. A. Talbot Rogers, Bromley.
Dr. C. H. Sedgwick, Rotherham.
Dr. S. Wand, Birmingham.
Dr. S. A. Winstanley, Urmston, Lancs.

3 Representatives of the Royal College of Physicians

Lord Moran, London.
Dr. H. E. A. Boldero, London.
Prof. Henry Cohen, Liverpool.

3 Representatives of the Royal College of Surgeons

Sir Alfred Webb-Johnson, London.
Sir W. Girling Ball, London.
Mr. H. S. Souttar, London.

2 Representatives of the Royal College of Obstetricians and Gynaecologists

Mr. Eardley Holland, London.
Mr. A. A. Gemmell, Liverpool.

3 Representatives of the Royal Scottish Medical Corporations

Prof. C. McNeil, Edinburgh.
Mr. H. Wade, Edinburgh.
Dr. J. H. Macdonald, Luss, Dumbartonshire.

2 Representatives of the Society of Medical Officers of Health

Prof. R. M. F. Picken, Cardiff.
Dr. G. F. Buchan, London.

1 Representative of the Medical Women's Federation

Dr. Mary Esslemont, Aberdeen.

1 Representative of the Society of Apothecaries

Dr. H. Seaward Morley, Midhurst, Sussex.

No General Releases

The man in the street is no military expert, though he may sometimes think he is, but when the Minister of Information says of the Deputy Prime Minister that, amicable as are their relations at present, in two or three months they may not be on speaking terms, the man who is still in the street may be forgiven for supposing that the European war is nearer to ending than the military situation suggests. That being so, it is natural for doctors who are carrying on their practices under conditions of great strain to think that the time has come to apply for the return of colleagues on active service. But they are likely to be disappointed yet awhile.

A circular sent out not long ago by the Central Medical War Committee to secretaries of local committees states that because of the reduced numbers of new medical recruits allotted to the Services for 1944, the falling out from casualties and other causes, and the need to build up for the war in the Far East a much more extensive hospital organization than has been required in the West, there must still be a strict limitation in the number of applicants for release selected for recommendation to the Service Departments. The skies may brighten, but the burden will have to be borne for some while longer.

The Government Tuberculosis Scheme

The Government tuberculosis scheme came in for some criticism at the last meeting of the Public Health Committee of the B.M.A. It was stated that sanatorium treatment is often made less effective or of no effect at all because it is not available as early as it should have been. The attention of the Ministry is being drawn to this matter by the Association.

Another point of dissatisfaction! A group of almoners engaged in tuberculosis care work in the areas of about twenty important authorities have sent a letter to the Association stating that the maintenance allowance scheme is inadequate, that there should be increases in the allowances in certain respects, and a higher "ceiling" for discretionary allowances. These workers know what they are talking about, for nobody comes closer to the economic side of illness than the almoner. The matter is being referred to the representatives of the Association on the Joint Tuberculosis Council, and if the recommendations are endorsed the Minister will be asked to extend and improve the scale.

The Local Deus ex Machina

Just over thirty honorary local secretaries of the Association have relinquished office since the end of 1943. In three cases, unhappily, the office was rendered vacant by death. Twelve of the Branches or Divisions concerned were over-seas. It would be invidious here to pick out names from such a list, though there are two or three instances in which the name of the secretary has for many years been almost synonymous with the name of the Division.

The Association is always under a great debt of gratitude for this faithful local service. Many, perhaps most, Division secretaries are men in busy practice ; very often they are secretaries also of the Local Medical War Committee, perhaps of the Panel Committee, and have all sorts of irons in the fire and keep them all hot. The reorganization of the peripheral machinery is now under consideration, but I believe that the Division will remain the basic unit—although some Divisions may be made more compact and the secretary will still be the man who gets things done.

FROM THE PRESS CUTTINGS

"As soon as medicine becomes an agency in social or industrial organization it ceases to be of any value to the community. That is a far more important question than the much-publicized one of freedom of choice of doctor, which even now is not always possible. You don't need medical advice when you have a cold, and the doctor won't help you much anyhow. But the State demands that you go to the doctor and waste his time. There is a real danger of the increase of that kind of thing being brought about by a State Medical Service. . . . How can better facilities be provided without buying up the doctors and putting the working population under a medical Gestapo? . . . It can be done, but only if the State is content to ensure that an efficient health service available to all does exist, and does not attempt to force doctors on patients, patients on doctors, or its own officials on either."—*Glasgow Bulletin.*

STOCKHOLM'S NEW HOSPITAL

A new hospital remarkable in its dimensions and innovations has lately been inaugurated in Stockholm by the King of Sweden. It is called the *Södersjukhuset* ("Southern Hospital") and is situated on the southern outskirts of the Swedish capital, overlooking Lake Mälaren Fig. 1). When fully completed it will have wards for 1,200 in-patients and fifteen polyclinics capable of dealing with about 1,000 patients a day. The total staff of doctors, nurses, and assistants will be about 1,200, equal to the number of in-patients. The hospital will have 5,400 rooms and 50 lifts. The standard ward accommodation is for 32 patients in five 4-bed rooms, four 2-bed rooms (Fig. 2), and four 1-bed rooms, and every ward has its own solarium (Fig. 3). Attached to each ward there is a room intended for conferences with doctors and others. The entrance hall accommodates 2,000 people, equal to the anticipated number of patients' visitors. It is provided with a post office, a café, and various small shops for the purchase of gifts for patients, also a crèche in which small children may be left. Every clinic has its own waiting room, and the construction of the whole building is such that patients and others from one clinic or ward will not need to pass through another department. A multiple plan has been adopted for the special departments whereby, for example, the *x*-ray department has two examination rooms, both operated from a mutual control room, and in the clinic for physical therapy one nurse supervises the treatment in two rooms. Among other noteworthy features is the organization of the kitchen, which recognizes the importance of diet in a hospital. From a central kitchen on the upper floor the food is conveyed in a semi-finished state to eleven branch kitchens (Fig. 4), where it is cooked and seasoned, and where special-diet dishes are prepared. Thence the food goes straight down in lifts to the several wards, and the patients gain from the rapid service of meals and from a more varied dietary in accordance with their needs.

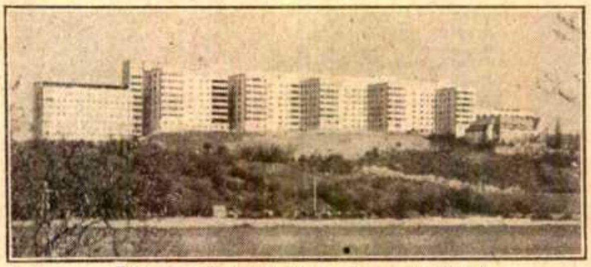

FIG. 1.—General view of new hospital.

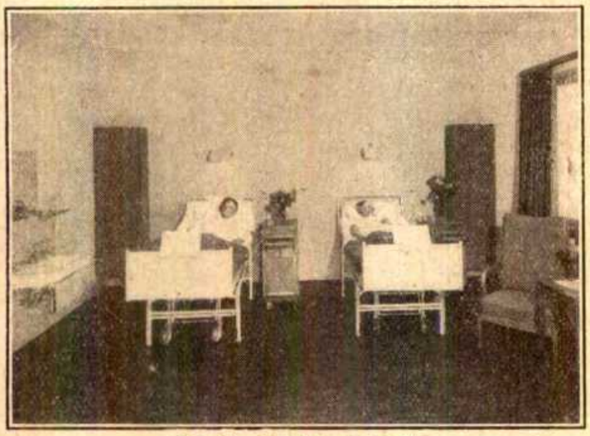

FIG. 2.—Interior of ward.

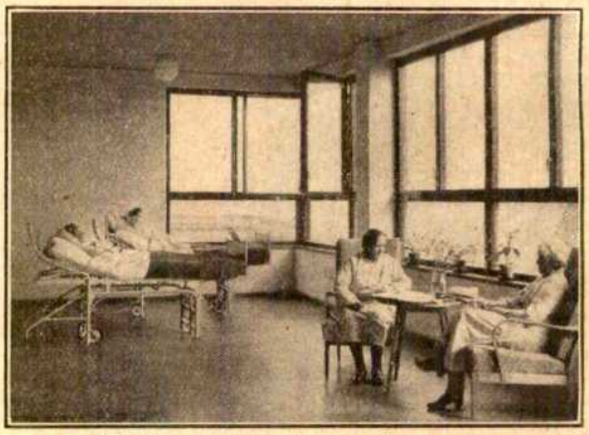

FIG. 3.—A solarium in one of the wards.

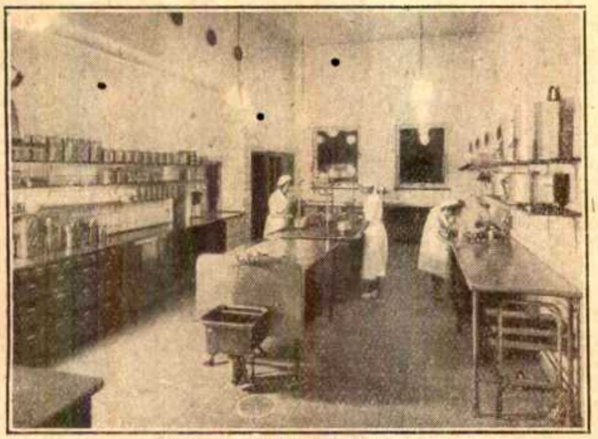

FIG. 4.—A branch kitchen.

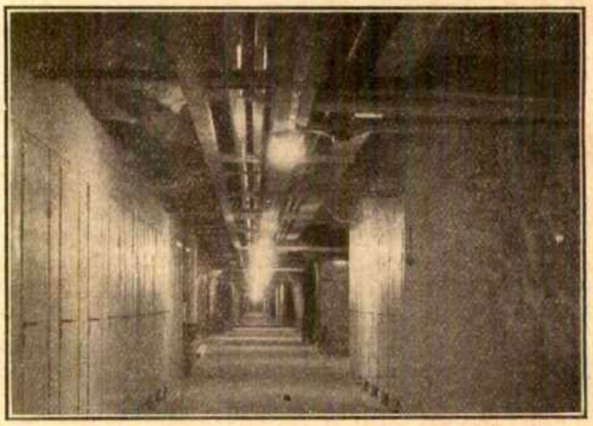

FIG. 5.—The central corridor in the bomb-proof shelter.

Some figures are interesting. The hospital, which is Government-owned, is expected to cost before it is completed 50 million kronor (£3 million), but the price of treatment is very moderate—for an in-patient the equivalent of five shillings a day for the first 14 days, and after that about 3s. 6d., and for a clinic out-patient three shillings a visit. Each of the general and special clinics is under the direction of a chief physician or surgeon with from three to five assistant medical officers, one of whom acts as his deputy. The annual salary of the chief of a clinic is from £700 to £900, but he is free to undertake private practice so far as his regular hospital duties allow. The salary of the assistants is not much less, from £600 to £750, but they are forbidden to practise privately. One of the senior members of the medical staff, besides his ordinary professional work as head of a clinic, is in charge of the administration of the hospital and receives a special fee for this. In order to make the office less onerous he has several administrative officials working immediately under him. He is in fact the part-time medical superintendent of the whole institution.

It is an ironical comment upon the civilization which has constructed probably (with another modern hospital, the Carolinian, to the north of Stockholm, which was opened four years ago) the most commodious and resourceful hospital and public health centre in Europe that beneath the building, 24 feet down in solid rock, there should have been built a gas-proof and bomb-proof underground hospital, where 1,000 patients can be treated for one whole month without communication with the outside world (Fig. 5). This grim reserve hospital comprises 12 wards and two operating theatres, and has its own water and electric supply. Scandinavia sets the lead in many adventures in social progress, but its faith in the political future does not seem to be stimulating. Yet what else could the prudent designers of this new hospital do, with Nazi Germany glaring across the Baltic at a neutral country whose neighbours had been violated?

REGIONAL HOSPITAL PLANNING

The recently issued report of the Medical Services Committee of the Yorkshire Regional Hospitals Council contains much of interest just now when regional planning is a recurrent subject of discussion among those concerned with the future of our hospitals. The committee, which included members of the staffs of voluntary and municipal hospitals in the area, medical officers of health, representatives of the Faculty of Medicine of Leeds University, and nine general practitioners practising within the region, worked through a number of subcommittees (seventeen in all) for the different departments of medicine and surgery and for dentistry. In a preamble the report defines the purpose of regionalism as applied to hospitals to be the provision "of every required form of hospital service for each individual in the region. . . . Hospitals in a region should be linked in such a way that all specialist services will be generally available."

Three main needs of the hospitals in the area are: (1) A big increase in the number of beds, better out-patient accommodation, and improved facilities for diagnosis and treatment. (2) More consultants and specialists. (3) More special services, by extension of existing ones for thoracic surgery, radiotherapy, etc., and by provision of new ones—e.g., for plastic surgery. Hospital care is to be provided at three different types of institution: (1) divisional hospital centres; (2) district hospital centres; and (3) peripheral hospitals. The first of these, the divisional hospital centres, are to be at Leeds, Bradford, and Hull; Leeds, as the university city, being the main one. In addition to their teaching facilities these centres will provide all that is required for such special procedures as thoracic surgery, neurosurgery, plastic surgery, etc. More bed accommodation in divisional hospital centres is to be secured by building in or near towns—where necessary by enlarging existing institutions—and not by building new general hospitals in country districts away from urban amenities.

District hospital centres, of which nine are proposed in some of the biggest cities, are to be staffed by men who are wholly engaged as consultants. Resident in the area will be consultants in medicine, surgery, gynaecology and obstetrics, while there will be visiting consultants in other specialties. Twenty-one peripheral hospitals are suggested (the term peripheral is not used in its geographical sense); these will not have a resident medical officer; patients will be under the immediate control and care of a general practitioner, consultants being called in to advise and sometimes to operate in emergency. In these peripheral hospitals the report sees a solution of the problem of providing treatment as near to the patients' homes and relatives as possible, good nursing for patients not requiring special surgical and medical skill, and last, but by no means least, the contact with hospital work which is so much desired by general practitioners. The committee considers that major surgery should be done in peripheral hospitals where this is needed, but only by men of consultant rank; it goes so far as to suggest that surgery by the G.P. will disappear, but it stipulates that all G.P.s in the area should be on the staff of the peripheral hospital.

On the question of hospital appointments and staffing the committee recognizes the danger of "in-breeding" and at the same time the importance of allowing the ultimate responsibility for an appointment to rest with hospital authorities. But it suggests that the procedure to follow should be that proposed in the White Paper—namely, an expert advisory body, which would put forward a number of suitable candidates from whom the hospital would make its final choice. The system of appointing "full" and "assistant" consultants to the staff should continue, but the committee strongly recommends that each assistant should be given adequate scope (beds, out-patient accommodation, etc.) to enable him to do work that specially interests him and gives him freedom of action.

The utmost co-operation between voluntary and municipal hospitals, such as Leeds with its Joint Hospitals Advisory Committee has had during the past few years, should be the aim throughout the region. There could then be: (*a*) a common visiting staff for all hospitals in a given hospital centre or area; (*b*) a central admission bureau, securing best use of available beds; (*c*) a co-ordinated bed-pool to be used by the common visiting staff; (*d*) a centralized out-patient department; (*e*) an adequate convalescent service, including rehabilitation; (*f*) a co-ordinated ambulance and transport service.

These recommendations are not utopian. Provided the region is large enough they should not be incapable of practical application. As the report concludes: "Planning on such a broad scale and from such a detached viewpoint would not have been possible if the area had been subdivided into smaller regions each with a population of 1/2 to 1 million. . . . The Yorkshire region with its population of 3 to 3½ millions is an ideal size for present hospital area planning."

Correspondence

Reallocation of Medical Man-power

SIR,—May I offer my contribution towards the plea of Service medical officers for an early and fair system of reallocation of medical man-power. Suggestions have already been made that E.M.S. doctors and some of the younger G.P.s who have not served in the armed Forces be called up until at least the age of 35, after the defeat of Germany.

It is quite self-evident that E.M.S. doctors have, in the vast majority of cases, been on the right side of the fence since war started, and it is not right or fair that they should continue to be so after Germany's defeat, and be allowed to drift back into private practice. These E.M.S. medical officers have had every opportunity to keep in touch with professional colleagues and take higher qualifications. They are in touch with affairs at home, and are ready to take the most desirable jobs after the war. They have had no spells of foreign service and for the most part little personal danger in comparison to their Service colleagues. Furthermore, they have had the happiness of being near wives and families, and the chance of a certain amount of home life.

In the interests of the future medical services of the country, it is essential that Service medical officers be given the opportunity for postgraduate study, and that an early release be given to those who have had the serious gap of five years away from clinical practice. A reallocation of medical man-power would meet the problem. Young E.M.S. doctors with up-to-date experience should be transferred to the Forces, and their places in civilian life taken by Service M.O.s of five years' seniority or more, and particularly those over 30 with wives and families. I appeal to the Central Medical War Committee to make a fair and early legislation for the urgent reallocation of medical man-power on these lines.—I am, etc.,

J. L. ADLINGTON,
Surg. Lieut., R.N.V.R.

War Gratuities

SIR,—It is interesting to compare the position of two individuals in relation to the official reward (?) which they will receive from their country for their services. "A" joined the regular service in August, 1939, taking a short-service commission. In August, 1944, he received a gratuity of £1,000. "B" joined the Volunteer Reserve, being a general practitioner, in August, 1938, and was called up for service in August, 1939, giving up his general practice, which largely vanished in his absence. He will receive, supposing he is discharged in August, 1945, something a little more or less than (depending on his rank) £100. It is rather difficult to see that the sacrifice made by "A" is greater than the sacrifice made by "B," and it would be rather difficult to find the reason for such differentiation in the relative values to be put upon their services to their country. In the Service "A" will be senior to "B" and therefore will have got preference in rank and promotion, etc.—I am, etc.,

R. W. DURAND,
Wing Cmdr., R.A.F.V.R.

Towards Agreement

SIR,—In his letter Dr. H. J. Selby complains that public respect and support have not secured for us an adequate or reasonable fee (*Supplement*, Feb. 17, p. 21). This is because the public has not been convinced that the panel fee is inadequate. I therefore repeat that the success of a State medical service will depend on the agreement of a just and adequate fee from the beginning, and we must insist on this now.

He asks whether public respect and support are likely to influence a Government determined to hoist a State medical service on the country with the public forbidden a voice in the matter. The answer is most certainly, Yes, should the Government ever attempt such tactics. He also asks whether they can influence any future Government when the planners have obtained their final objective—the destruction of all personal freedom and liberty. Again the answer is that public respect and support are the only safeguards which could ultimately prevent such an unwholesome state.

Finally, to label the White Paper totalitarian no longer misleads the majority of the community, neither does it worry a very large minority (if indeed it is a minority) of the medical profession. Let us therefore do our best to make the scheme as near perfect as possible so that we may retain our most valuable asset—the respect and support of the community.—I am, etc.,

Stroud HERMAN MOULD.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY MARCH 31 1945

THE NEGOTIATIONS

The Council of the B.M.A. at its meeting on March 21 received the report of the Negotiating Committee. After full discussion the Council decided to make a full report with recommendations to a Special Representative Meeting which will begin at 10 a.m. on Thursday, May 3, and continue until the business is completed. It is expected that the meeting will last until the evening of Friday, May 4. The report of the Council is a confidential document in that it cannot be published, but it will be sent direct to every member of the profession, whether members of the Association or not.

The Council decided to request Divisions to make arrangements for an early meeting or meetings of the profession for the purpose of discussing the report and instructing Representatives.

HEARD AT HEADQUARTERS

The Late President

Obituary tributes in the Association Council are always brief, but Dr. Dain's few words about the late President were exactly what the occasion required. Most of the members of the Council on the day before the special meeting had attended the memorial service at the Abbey, and the chairman remarked that those who had done so must have appreciated from the size and distinction of that assembly what a great figure Lord Dawson was in the life of the nation. He added that over a long term of years Lord Dawson's interest in the progress of medicine and of medical services had been deep and unflagging. Not often, he said, did the successful physician, esteemed for his own work in the clinical field, take the same active interest as Lord Dawson had done in the social and political aspects of medicine. It was not merely because of his name that the Association chose him twice as its President, but because he had a contribution to make of outstanding value in the discussions and decisions of these changing times.

A Hospital Year

The surplus income of voluntary hospitals in 1941, to which I referred in these notes a week or two ago (March 17) is, of course, like many surpluses now accumulating, largely illusory. It is due to the withholding of expenditure on the erection of new buildings and repairs. Of the various sources of hospital income, while subscriptions and donations are well maintained, legacies have fallen considerably during the war. This is, no doubt, a reflection of increased taxation, and also perhaps in part a consequence of the knowledge that a National Health Service is in contemplation, although in 1941 no detailed proposals had been made, and most of those who bequeathed legacies which fell due in that year had presumably made their dispositions much earlier. Apart from its voluminous statistics, the *Hospitals Year Book* (Central Bureau of Hospital Information, 12, Grosvenor Crescent, London, S.W.1) is a directory of both voluntary and municipal and public assistance institutions and of many other services. One useful section gives particulars of something like 500 contributory schemes and Hospital Saturday Funds and of 60 provident schemes for treatment in private wards, about half of them under independent control and half under control of individual hospitals. There is also a lengthy article examining the discussions which the White Paper on a National Health Service has provoked.

Lady Councillor

The first woman member of the B.M.A. Council to be elected by the women members of the Association is Dr. Janet Aitken. Dr. Aitken is an appropriate choice in more than one respect, for her post as senior physician to the Elizabeth Garrett Anderson Hospital furnishes a link with the name of the first woman member of the Association, who was Elizabeth Garrett Anderson herself.

Dr. Garrett Anderson was elected a member by the Metropolitan Counties Branch just over seventy years ago. The circumstances caused a good deal of controversy at the time, and Sir William Jenner threatened to resign in consequence of "lady members being permitted to attend the meetings of the Association." In 1878, after a plebiscite which gave a three to one majority against the inclusion of women, it was resolved that "no female shall be eligible for election as a member of the Association," words which were expunged in 1892, since when women have continued to be elected, and there has been equality between the sexes.

There have been two previous women members of Council—the late Dr. Christine Murrell and Dame Louise McIlroy—but Dr. Aitken is the first to be elected under the new rule which gives the women members of the Association the right to vote for one representative, so that the inclusion of a woman member of the Council is no longer dependent on predominant male suffrage.

An Experiment in Health Centres

I see that a committee appointed to inquire into setting up a medical benefit scheme for all European officials in the public service in the Union of South Africa is recommending a scheme with full cover to be subsidized by the Government on a pound-for-pound basis. One of its recommendations is that a medical or health centre rather than an individual private practitioner should be the unit of the service, and the committee cites the scheme submitted to the Australian Government and the national health service for New Zealand, both of which favour the health centre system.

But South Africa is not precipitate in this matter. On the face of it, in a country such as South Africa, with public servants, like other white population, thinly spread over the territory, a uniform medical service seems impossible of adoption. Therefore the health centre is to begin as an experiment. Only one such centre is to be established—in the city of Pretoria. It is to be adequately equipped and staffed with doctors, nurses, dentists, and health visitors, all on a full-time salaried basis.

Only if this proves a success will similar health centres with any modifications which experience has shown to be desirable be established in other areas. Until the success of the Pretoria experiment has been demonstrated the members of the public service in the Union are to be allowed free choice of doctor. Pretoria has a European population of some 76,000, less than half the European population of Capetown, but it is the administrative capital of the Union, with a large number of officials, and that no doubt has determined the choice.

No Criticism

To those who recall the early history of the campaign against venereal diseases there is something quite remarkable in the statement in a letter which the Minister of Health has issued to all local authorities. He refers to the large posters now on every hoarding, and he says that these have raised no criticism, and that there is evidence that the educational campaign as a whole continues to have the approval of the vast majority of the public.

One can imagine that such posters years ago, admirable as they are, would have shocked certain sections of the public, who would have deprecated the very mention of the name of the disease, and have considered the offer of advice and treatment facilities as making the world safe for vice, this notwithstanding the emphasis on every poster that "clean living is the only safeguard."

This educational publicity is to be intensified during the next twelve months. It is undertaken by the Ministry of Health in collaboration with the Ministry of Information and the Central Council for Health Education.

Service Candidates

At the special meeting of the Council last week the names of as many as 340 candidates serving in H.M. Forces were up for election as members of the B.M.A.—surely a record number.

What is Canvassing?

SIR,—Canvassing by private doctors is still an ethical crime punishable by the G.M.C. Canvassing by public doctors and clinics is rampant, and encouraged by the authorities. Is there one law for public doctors and another for private doctors? Logically, either canvassing by private doctors must be allowed or canvassing by public doctors must be stopped.

As we become State-controlled, totalitarian, National Socialist, or whatever is coming to us, it rather appears that canvassing is likely to become more prevalent. Is it not time that the G.M.C. cleared the air by prohibiting canvassing by public doctors and their servants? This letter may sound rather quarrelsome, but canvassing is taking place everywhere all the time, and extending rapidly.—I am, etc.,

Rotherham. ERIC COLDREY.

A "Black Market" in Medical Practice

SIR,—Dr. Peter Parry (*Supplement*, Feb. 17, p. 25) is right in believing the opposition to this new outburst of totalitarianism to be strong. Practitioners have no redress, for they know that their opinions are asked just a little later than the most recent *fait accompli*. Hence they are in the position of running to catch the train that left yesterday! Moreover, practices need daily and hourly attention to keep them on an even keel; while the brainy ones—who acquiesced in the physical and moral rot of a few years ago of keeping millions idle; who acquiesced and still acquiesce in untold acres of slums and dirt, in neglect of children, the only hope of the future—these have ample leisure to concoct means of shackling a great profession.

It is the humbug of it all that is hard to bear.—I am, etc.,

Twickenham. WILFRID W. PHILLIPS.

H.M. Forces Appointments

ARMY

War Subs. Lieut.-Col. R. Marnham, R.A.M.C., to be a Consultant, and has been granted the local rank of Brig.

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. T. P. Buist, having attained the age for retirement, is retained on the Active List supernumerary to establishment.

Majors R. A. Bennett and W. A. D. Drummond to be Lieut.-Cols.

Capt. O. R. L. L. Plunkett has retired on account of disability, and has been granted the honorary rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieut. J. V. Shepheard, from Royal Welch Fus., to be Lieut.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. R. C. Forrester has relinquished his commission on account of disability, and has been granted the honorary rank of Major.

To be Lieuts.: B. Barrowman, G. King, J. L. Lanceley, and F. B. Notley.

ROYAL AIR FORCE

ROYAL AIR FORCE VOLUNTEER RESERVE

Fl. Lieut. H. B. Wilson has relinquished his commission on account of medical unfitness for Air Force service, retaining the rank of Squad. Ldr.

Fl. Lieut. M. L. Gaudin has relinquished his commission on appointment to the R.C.A.F.

Flying Officers G. G. Lindsay, T. P. O'Grady, D. O'Keefe, and C. E. Williams to be War Subs. Fl. Lieuts.

M. J. M. Solomons to be Flying Officer (Emergency).

WOMEN'S FORCES

EMPLOYED WITH THE MEDICAL BRANCH OF THE R.A.F.

Fl. Lieut. J. S. McFarlane has resigned her commission.

INDIAN MEDICAL SERVICE

Lieut.-Cols. W. E. R. Dimond, C.I.E., O.B.E., and D. Clyde, C.I.E., to be Cols.

Capt. (Mrs.) G. O. W. Millington, whose resignation of commission was notified in the *London Gazette* of Dec. 22, 1944, has been granted the honorary rank of Capt.

CONSULTANT AND SPECIALIST OPINION

A series of meetings will be held during the next few weeks to provide consultants and specialists in all parts of England and Wales with an opportunity to discuss those aspects of the proposed comprehensive national health service affecting their branch of practice. The meetings will be open to all practitioners of consultant and specialist status, whether engaged exclusively in consultant practice or not, members and non-members of the B.M.A., teachers and non-teachers.

The meetings so far arranged are as follows:

Bristol.—Thursday, March 8, at 2.30 p.m. in the University of Bristol, Small Physics Lecture Room, at Royal Fort. Dr. Birrell will open the discussion.

Nottingham.—Sunday, March 11, at 5 p.m. at 64, St. James Street, Nottingham. Mr. S. A. S. Malkin will open the discussion; Dr. H. Guy Dain, Chairman of Council, B.M.A., will be present. (This meeting is to be preceded by a general meeting of the Branch at 2.45 p.m. on the same day at the Pearson Hall, General Hospital, Nottingham, which Dr. Dain will address and to which all members of the local profession are invited.)

Manchester.—Thursday, March 15, at 4.30 p.m. in the Lay Board Room of the Royal Infirmary, Manchester. Prof. Platt will open the discussion.

Cambridge.—Friday, March 16, at 11.30 a.m. at the Dorothy Café, Sidney Street, Cambridge. Dr. Ff. Roberts will open the discussion.

Birmingham.—Saturday, March 17, at 2.15 p.m. at Nuffield House, Queen Elizabeth Hospital, Birmingham. Dr. Philip Cloake will open the discussion.

Brighton.—Sunday, March 18, at 3 p.m. at the Royal Pavilion, Brighton. Mr. H. J. McCurrich will open the discussion.

Leeds.—Wednesday, March 21, at 3 p.m in the Physiology Lecture Theatre, Medical School, Leeds. Dr. W. MacAdam will open the discussion.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1) Week-end course in rheumatism, St. Stephen's Hospital, Sat. and Sun., March 24 and 25. (2) Revision course in anaesthetics, various London hospitals, all day, April 9 to 21. (3) Final F.R.C.S. courses as follows: Clinical demonstrations, Metropolitan Hospital, Weds., March 7, 21, and April 18, 5 p.m.; Demonstrations in the wards, London Homoeopathic Hospital, Weds., March 14, 21, 28, and April 11 and 18, 5.30 p.m.; Clinical demonstrations, St. Mary Islington and Archway Hospitals, Weds., March 21 and 28, Tues., April 3, and Wed., April 11, 2 p.m.; Week-end course in surgery, Hillingdon County Hospital, Sat. and Sun., April 14 and 15, all day; Demonstration of selected cases at London Homoeopathic Hospital, Sat., April 21, 2.30 p.m.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*West End Hospital for Nervous Diseases:* Mon., Tues., Fri., 2.30 p.m., Course in Neurology (suitable for M.R.C.P.). *Radcliffe Infirmary, Oxford:* Daily, Revision course in anaesthetics. *Metropolitan General Hospital:* Wed. afternoon, Final F.R.C.S. surgery demonstration. *Brompton Hospital:* Tues. and Thurs. afternoons, M.R.C.P. course in chest diseases. *North Middlesex County Hospital:* All day Sat. and Sun., March 10 and 11, Week-end course in general medicine.

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m., Dr. J. Gillies: Intravenous Anaesthesia.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—Lectures on Applied Physiology by Prof. John Beattie: *Mon.*, 2.30 p.m., Prevention of Shock; *Wed.*, 2.30 p.m., Factors concerned in Wound Healing and Repair; *Fri.* 2.30 p.m., Post-operative Pulmonary Complications. Lectures on Anatomy by Prof. A. J. E Cave: *Mon.*, 4 p.m., The Sphincteric and Diaphragmatic Muscles; *Wed.*, 4 p.m., General Anatomy of the Lymphatic System; *Fri.*, 4 p.m. Vasculature of the Intestine.

ROYAL SOCIETY OF MEDICINE.—*Tues.*, 5 p.m. General meeting of Fellows. *Wed.*, 2.30 p.m Section of History of Medicine; 5 p.m., Section of Surgery. *Fri.*, 2.30 p.m., Clinical Section.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, W.—*Wed.*, 3.30 p.m., Lord Forrester: Industry and its Environment—Physical and Social.

ROYAL INSTITUTION, 21, Albemarle Street, W.—*Tues.*, 5.15 p.m., Sir Henry Dale, P.R.S.: Actions of Involuntary Nerves and of Substances which Mimic or Paralyse their Effects. *Fri.*, 5 p.m Prof. David Brunt, F.R.S.: Climate and Human Comfort.

B.M.A.: Branch and Division Meetings to be Held

EXETER DIVISION.—At Princess Elizabeth Orthopaedic Hospital, Exeter, Sat., March 10, 2.45 p.m., Clinical meeting. Lecture-demonstrations on diagnosis, treatment, and after-care of typical cases of peripheral nerve injuries.

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle-upon-Tyne, Thurs., March 8, 2.15 p.m., Clinical demonstration in the Orthopaedic Department by Messrs. C. G. Irwin and J. K. Stanger. 3.45 p.m., Address by Dr. Robert Forbes: Medico-Legal Aspects of Artificial Insemination. Members of H.M. Forces stationed in the area of the Branch are invited.

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Shrewsbury, Tues., March 6, 3.30 p.m., Meeting of Clinical and Pathological Section. Discussion to be opened by Dr. A J Rhodes on Penicillin in Civilian Practice.

BIRTHS, MARRIAGES, & DEATHS

The charge for inserting announcements under this head is 10s. 6d. This amount should be forwarded with the notice, authenticated with the name and address of the sender, and should reach the Advertisement Manager not later than first post Monday morning to ensure insertion in the current issue.

BIRTHS

COUPLAND.—On Feb. 9, 1945, at Treherbert, to Helen (*née* Irons, S.R.N.), wife of H. G. Coupland, M.R.C.S., L.R.C.P., 303, Norbury Avenue, S.W.16, a son.

LISTER.—On Dec. 15, 1944, at King's College Hospital, to Eileen (*née* Trafford), wife of Capt. John Lister, R.A.M.C., B.L.A., a son.

McDONAGH.—On Feb. 20, 1945, at 39, Palmerston Place, Edinburgh, to Debonnaire (*née* Hay), wife of J. Owen McDonagh, M.B., B.S., of Stanley, Perthshire, a daughter.

MURRAY.—On Feb. 13, 1945, at Haywood Private Maternity Hospital, Staffs, to Joyce (*née* Turnbull), wife of Major N. W. N. Murray, R.A.M.C., B.L.A., a daughter.

PAUL.—On Feb. 23, 1945, at Benslow Nursing Home, Hitchin, Herts, to Una (*née* Charlick) wife of Lieut. Bernard G. Paul, R.A.M.C., a daughter—Avis.

DEATHS

DALE.—On Feb. 18, 1945, at "Thornbeck," 17, Mansion House Road, Paisley, Helen Jamieson, elder daughter of the late James and Helen Dale, and beloved sister of Dr. John S. Dale and Mrs A. H. J. D. Thomson.

LEETE.—On Feb. 15, 1945, after a short illness, at The Doctor's House, City Hospital, Cottingham, E. Yorks, Harold Mason Leete, M.D., Medical Superintendent, aged 50 years.

O'DRISCOLL.—On Jan. 29, 1945, at Middlesex Hospital, Jeremiah O'Driscoll, M.D., M.Ch., B.A., late of Hilerea, Co. Cork, aged 42 years. R.I.P.

PRICE.—On Feb. 8, 1945, at the General Hospital, Walsall, Sydney Edgar Price, L.R.C.P., L.R.C.S.Ed., L.R.F.P.S.Glas., of 15, Belvidere Road, Walsall, aged 69 years, dearly beloved husband of Emma Maud, eldest son of the late Dr. Edwin Price, of Dudley Port House, Tipton.

SHARPE.—On Feb. 21, 1945, at Roughlee, Longton, near Preston, Frederick Augustus Sharpe, M.D., B.S., D.P.H., Medical Officer of Health for Preston, beloved husband of Eva Margaret Sharpe

PAY OF RESIDENT MEDICAL OFFICERS

Industrial Court Award in Australia

Medical students in Queensland, Australia, have recently scored a decided victory in a fight for better terms of employment after graduation. This is said to be the first occasion on which students anywhere have united for this purpose. The Queensland Industrial Court has granted an application of the junior resident medical officers of the Brisbane General Hospital for an award governing their salary and conditions. The Court has awarded a salary of £350 a year, a 54-hour week averaged over a period of four weeks, and a maximum shift of 16 hours. This does not concede the full extent of the claim, which was for a salary of £500 a year, but it is a considerable advance upon the £200 which these officers have been receiving, with work extending over an unlimited number of hours a week, and shifts as dictated by the hospital board. Although the case was carried to its conclusion by a group of resident medical officers, it was initiated by a number of students in the University of Queensland Medical Society, who laid down the plan of campaign.

The Court stated that this was the first occasion on which any industrial tribunal had been asked to investigate the pay and working hours of members of the medical profession, but, it added, the applicants were obviously employees within the meaning of the Industrial Acts, and were performing very able and valuable service for their employers and the community, so that there was no reason why the Court should not deal with the application.

The resident medical officers were represented by Dr. F. Schwarz, who referred to the numerous and important duties of R.M.O.s, and the fact that they carried out these duties as responsible agents; the hospital board did not take responsibility for their mistakes. The average age of the plaintiffs, he said, was 25 years, but on their pay it would be economically very difficult for them to contemplate marriage, or to set about buying a practice or undertaking post-graduate study, possibly at an oversea medical school.

On behalf of the hospital board it was contended that the claim was extravagant. The salary had been already increased in 1940 from £140 to £200. The period of residence was always considered an apprenticeship. The newly qualified man came to hospital with a theoretical knowledge only, and it was at the hospital he learned how to apply it in practical work. Although it was admitted there were exceptionally busy periods when long stretches of duty were worked, the R.M.O.s were not required to work more than an average of 54 hours a week.

In making its award of £350 a year and adjusting the working time, the Court took the view that the duties of these R.M.O.s deserved serious consideration. It was true that certain cases were referred to senior men when they were deemed sufficiently important and difficult, but the evidence was that in practice the R.M.O. was required to exercise his own discretion, to treat many cases on his own initiative, and to decide what cases should be referred. It was realized that the period of residence in a public hospital was a valuable experience to a young doctor as a postgraduate course of training; at the same time, these young practitioners were making a valuable contribution to the medical services of the community and deserved greater recognition than their present salary indicated. The Court compared their salary with that of first-year dentists and with medical graduates holding State fellowships, and in that comparison it appeared at a disadvantage. As these R.M.O.s entered hospital as fully qualified doctors with all the duties and responsibilities attached to their position, and were required often to work very long hours, it was anomalous that they should be paid a merely nominal salary for their services.

The Brisbane students' newspaper, *Semper Floreat*, reports the result under the headings: "Medical History Made: Social Justice Triumphs," and comments, "This is a proud day for democracy."

THE FUTURE OF SCOTTISH HOSPITALS

In an address recently delivered to the Royal Philosophical Society of Glasgow Mr. Robert F. Barclay, chairman of the Royal Hospital for Sick Children in that city, criticized the Government's White Paper scheme and pleaded for definite action for the preservation of the voluntary hospitals.

The financial proposals of the White Paper he declared to be extremely unsatisfactory—in fact, impossible. He said that if effect was given to them the power of the voluntary hospitals to pay their way and to raise money for extensions, improvements, and renovations would be at an end. The proposal that in these circumstances voluntary hospitals should rely on payments from local authorities was objectionable on the ground that it would tend to restrict the treatment of patients to hospitals in the region in which they happened to reside; it would make voluntary hospitals territorial instead of being, as at present, national institutions, and it would reduce them to a position of subservience to local authorities, which should not be tolerated.

Alternative to the Government's Proposals

Mr. Barclay went on to submit certain constructive suggestions. He proposed that the Secretary of State for Scotland, exercising his functions through the Department of Health, should be charged with the administration of a new hospital service. For this purpose Scotland should be divided into five regions—four of them based on the university towns, and the fifth on Inverness—and in each region there should be a council consisting of representatives appointed in equal numbers by the voluntary hospitals and the local authorities, together with representatives of the university, the medical profession, and, possibly, the nursing profession. These councils should not be merely the consultative or advisory bodies suggested in the White Paper but should have the duty of preparing schemes for co-ordination and co-operation with the hospital services in the region. The schemes, after receiving the approval of the Secretary of State, who would make any amendments he thought fit, would then be adjusted and administered by these regional councils.

In order to complete the scheme Mr. Barclay proposed a Scottish National Hospital Council to assist and co-ordinate the work of the regional councils; also a Medical Advisory Committee (or committees), national or regional, to advise the Secretary of State, the regional councils, the voluntary hospitals, and the local authorities on all medical matters, especially concerning important appointments. A further principle laid down was that the voluntary hospitals should continue without any territorial restrictions, thereby ensuring a service to sparsely populated areas.

Correspondence

Association of Non-teaching Voluntary Hospitals

SIR,—In March, 1944, I got in touch with all the honorary staffs of those major (non-teaching) voluntary hospitals recognized by the Royal College of Surgeons as places where resident appointments would qualify the holders to become candidates for the F.R.C.S. An inaugural meeting was held in September, 1944, and organizers appointed in each B.H.A. area. Meetings were held in these areas, and a member elected to become a member of the council of the new association.

The association has never sought direct approach to the Government, and it has pledged itself to support the Central Consultant Services (Beveridge) Committee which meets at the Royal College of Physicians. Its function is to safeguard the interests of those consultants and specialists not attached to undergraduate teaching schools. The response has been very gratifying. For administrative convenience and for other reasons which space prevents enlarging upon, admission to membership is by the honorary staff as a whole of one of the following types of hospitals: (1) A (non-teaching) voluntary hospital of 200 beds or over. (2) Any (non-teaching) voluntary hospital recognized by one of the Royal Colleges as a place where resident appointments qualify holders to become candidates for the higher diplomas. (3) Any (non-teaching) voluntary hospital of which the honorary staff *in charge of beds* is 75% engaged in consulting or specialist practice only. (4) Other (non-teaching) voluntary hospitals at the discretion of the council.

Already practically all Types 1 and 2 hospitals have joined. Under 3 there are many special hospitals whose outlook is consultant but who have not yet been in touch with this association. For their benefit the following list of the council may help them to make personal contact with their local representative:—

President, Mr. H. J. McCurrich, 19, Palmeira Avenue, Hove.
Hon. Secretary, Mr. M. P. Reddington, 75, Wimpole Street, London, W.1.
Hon. Treasurer, Mr. K. Heritage, 2, Harley Street, London, W.1.

British Hospital Association Areas:

1. Berks, Bucks, and Oxon. Not yet elected.
2. Bristol and Somerset. Mr. C. E. Kindersley, 18, The Circus, Bath.
3. Cornwall. Dr. C. T. Andrews, Royal Cornwall Infirmary, Truro.
4. Devon. Dr. C. J. Fuller, 6, Barnfield Crescent, Exeter.
5. Eastern Area. Mr. J. M. Ridley Thomas, 3, Christchurch Road, Newmarket Road, Norwich.

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY MARCH 10 1945

HEARD AT HEADQUARTERS

The Negotiating Committee

The Negotiating Committee or its Administration Subcommittee has now held seven meetings with the Minister of Health. At its first meeting it appointed Dr. Guy Dain as its chairman, Sir Alfred Webb-Johnson vice-chairman, and Dr. Charles Hill secretary. The main subject of the discussion so far has been the administrative structure of a National Health Service, and the views of the profession have been put forward to the Minister and his officials. The Negotiating Committee met at B.M.A. House on March 7 to consider the position now reached on this important section of its task, and, as stated in last week's *Supplement*, the Association's members will report progress to a special meeting of the Council on March 21.

The 100% Issue in America

The "Principles of a Nation-wide Health Program" have been put forward in the United States above the names of twenty-nine sponsors, many of them well-known men and women in American medicine. The report is published by the Committee on Medical Economics, New York. It has many points of interest on this side. The demand there as here is for medical services to be made financially accessible to all, and the method favoured by these sponsors is a national system of contributory health insurance.

It is stated that American families ordinarily spend about 4% of their income on medical services of all kinds (about 3% on doctors and hospitals). Nine-tenths of the American population are declared to need protection against the uneven and unpredictable costs of sickness.

The majority of the twenty-nine consider that limitation to certain income groups is not desirable, but three out of the twenty-nine think that the service should be only for those whose incomes fall below a certain figure, somewhere between £400 and £600. All, apparently, agree that those who want to "purchase" medical care outside any national health system should be free to do so.

[Some account of the medical services of the United States appears on page 36.]

Maternity Fees in Scotland

Our Scottish colleagues have scored a noteworthy success. Once more their native pertinacity has been rewarded. For years the Scottish Committee of the B.M.A. has represented to the Department of Health that the fees paid to doctors under the Maternity Services Act passed eight years ago were inadequate. Not only was the payment meagre, but the differentiation between the insured and the non-insured was perpetuated.

Thus the basic fee was 36s. for the insured woman (this for ante-natal, intra-natal, and post-natal services) and £2 for the non-insured. Even these figures, agreed to in 1938, were an improvement on the original figures of 25s. and 30s. respectively.

As announced in the *Supplement* of Feb. 24 (p. 29) the Department of Health has now agreed to the main proposals of the Scottish Committee, and is asking local authorities to incorporate the revised terms in their schemes. The basic fee for all services rendered by the doctor, whether the patient is an insured person or not, including services to any woman who is removed to hospital after labour begins, is to be £3 3s. If the woman is removed to hospital before the beginning of labour and is confined there, the fee is 25s. There are provisions for dividing the £3 3s. fee between the two practitioners concerned when a woman changes her residence during the relevant period.

A Differentiation Gone

Thus the differentiation between the insured and non-insured pregnant woman disappears from the Scottish maternity arrangements. This differentiation, which the Treasury has seemed loath to abandon, has been one of the unfortunate and irritating features of the service.

There are certain other points in the new terms. The same fees are payable, if ante-natal service has been rendered, should the pregnancy end in abortion or miscarriage. A wartime addition of 10% to mileage payments has also been agreed to. Another satisfactory point to have gained is an official definition of what constitutes labour. Labour is defined as "the period from the onset of the first pain until the final stage, including the repair of the perineum, if such repair is necessary and is done immediately."

Scotland's largest city is outside the service. The Glasgow Division has made representations to the Secretary of State that pressure should be brought on the local authority to come into line.

Inquisitorial

The constantly recurring dilemma of the doctor is illustrated by a letter which one doctor has received from an approved society. He had certified a woman as incapable of work by reason of advanced pregnancy, and the society sent a questionary which it hoped the doctor would be "good enough" to answer—the polite phrase is a sort of cover under which it would be possible to say, should any question arise afterwards, that the information was not demanded but was given by an obliging doctor.

The doctor is asked what in his opinion is the period of pregnancy at the date of the certificate, whether it is an uncomplicated pregnancy and, if not, what other condition is present, and whether the woman is fit for ordinary housework. The insurance doctor is under no obligation to answer such inquiries. If the woman has some disabling condition in addition to pregnancy it would be a breach of confidence to disclose it without her consent, and as for housework, "work" in the terms of N.H.I. certificates is normally understood to be a person's ordinary remunerative employment. But the point is that if the doctor disregards the request of the approved society it may mean that his patient will stand little or no chance of being paid sickness benefit. Many societies decline to pay on a certificate specifying pregnancy alone, but some pay on a certificate of advanced pregnancy.

The doctor in this case took the sensible course of answering the question as to the date of pregnancy, and wrote a letter pointing out that it was enough for him, and should be enough for those who had been in regular receipt of the insured woman's contributions, to know that there was interference with her capacity to earn her living in the way in which she had been accustomed.

Consultant and Specialist Opinion

Meetings are now being arranged in various areas for consultants and specialists to discuss their problems in relation to a National Health Service (*Supplement*, March 3, p. 34). They are open to practitioners of consultant and specialist status, whether members of the B.M.A. or not, and whether engaged exclusively in such practice or not. There are many points in the National Health Service proposals which affect consultants and specialists and which call for discussion. There is also the question of the establishment of a statutory list of consultants and specialists, on the desirability of which there are differences of view. And again, the Goodenough Committee's Report on Medical Schools furnishes further matter for the attention of consultants. Opinion on the future of the general practitioner services has more or less found its channels; that on the future of consultant and specialist services is less clear. The way to canalize it is by discussion.

6. East Midlands. Dr. J. P. W. Jamie, 7, de Montford Street, Leicester.
7. Essex. Dr. S. A. Propert, 47, Lexden Road, Colchester.
8. Gloucester, etc. Mr. O. E. J. McOustra, Hilton Lodge, Lansdowne Road, Cheltenham.
9. Hampshire and Dorset. Dr. C. B. S. Fuller, Royal Hampshire County Hospital, Winchester.
10. Kent. Dr. H. A. Treble, Kent and Canterbury Hospital, Canterbury.
11. London. Mr. A. L. Abel, 48, Harley Street, W.1; Mr. Hamilton Bailey, 149, Harley Street, W.1; Mr. Clifford Morson, 86, Brook Street, W.1.
12. Manchester and District. Not yet elected.
13. Merseyside. Mr. R. J. Martin, Sec. Medical Board, Birkenhead General Hospital, Birkenhead.
14. Middlesex. Mr. S. Garbutt, Harrow Hospital, Roxeth Hill, Harrow.
15. Northamptonshire, Bedfordshire, and Hertfordshire. Mr. A. R. Banham, 11, Billing Road, Northampton.
16. North-Eastern Area. Dr. R. E. Jowett, The Royal Infirmary, Sunderland.
17. Chester. Mr. A. W. Holgate, 24, Curzon Park, Chester.
18. North-Western Area. Dr. F. M. Hilliard, 171, Newton Drive, Blackpool.
19. Sheffield and District. Dr. L. Dougal Callander, Danum House, 6A, South Parade, Doncaster.
20. South Wales and Monmouthshire. Dr. W. V. Howells, 73, Walker Road, Swansea.
21. Surrey. Dr. A. Barnsley, Royal Surrey County Hospital, Guildford.
22. Sussex. Mr. J. H. R. Turton, 26, The Drive, Hove, 3.
23. West Midlands Area. Mr. Frank H. Edwards, 14, St. John's Hill, Shrewsbury.
24. Wiltshire. Mr. H. S. Taylor-Young, 9, New Street, Salisbury.
25. Yorkshire. Mr. Donald Watson, 33, Manor Row, Bradford.

It is hoped that all hospital staffs eligible to join will get in touch with their area representative. The fact that the majority of the members of council, including myself, are also members of the Beveridge Committee, should dispel any baseless rumours that independent action is intended, but we shall undoubtedly seek to influence that committee, and the fact that neither the Royal Colleges nor the B.M.A. elected a single member of the staff of a non-teaching hospital to the Negotiating Committee must considerably lessen its representative character when the number of beds controlled by the non-teaching hospitals is contrasted with those of the teaching hospitals. It is true that the Society of Apothecaries has nominated Dr. Morley of the West Sussex Hospital to be its representative—a choice in which I have every confidence—but the proportion of teaching to non-teaching representatives to deal with a problem that is not academic but concerns the future livelihood of all of us is out of any semblance of proportional representation. Furthermore, the election of this Negotiating Committee bears no resemblance to accepted democratic methods.—I am, etc.,

H. J. McCURRICH,
President, Association of the Major (Non-teaching) Voluntary Hospitals of England and Wales.

Hove.

Medical Demobilization

SIR,—It is to be hoped that the cry of "the exigencies of the Service" will not be accepted unquestioningly by the Central Medical War Committee. From three years' experience in the R.A.F. Medical Service these "exigencies" may well result from the "misemployment" and extravagant distribution of medical officers.

1. Misemployment.—Two-thirds of a station M.O.'s working day is spent in carrying out duties such as inspections of sanitation, cook-houses, doubtful food, and in the signing of innumerable forms. All these things could be done by an N.C.O. of average intelligence after a ten-days course of instruction. Further, non-specialist M.O.s are compelled to send to specialists any case, no matter how simple, requiring an alteration in medical category or in employment. The station M.O. cannot, for example, recommend that the airman, whose condition he has diagnosed as a chronic suppurative otitis media, be made unfit for the Tropics and unfit to be exposed to the noise of aircraft engines in a hangar. The result is three more forms and the waste of a specialist's time, not to mention that of the patient.

2. Distribution of M.O.s.—My own experience is illuminating. In 1942 I was posted to a non-operational flying unit of about 1,500 people. There were three M.O.s, and before I left our numbers increased to five; the newcomers were Polish and Czech M.O.s, both of whom had a working knowledge of English. In 1943 I went to a small R.A.F. H.Q. in a big city. Here two M.O.s had to care for 300 people at the H.Q. and to supervise sanitation at some half-dozen scattered units averaging 100 men at each, all within a radius of 200 miles. To assist in the enormity of the task each out-station had one local C.M.P. "on call," while at H.Q. itself we have three.

Such were my experiences two years ago. The lavish allotting of M.O.s is less obvious to-day. Their misemployment was never more so.—I am, etc.,

ANOTHER R.A.F. M.O.

Specialist Practices

SIR,—There must be hundreds of ophthalmic and ear, nose, and throat surgeons in the Provinces who have bought the goodwill of their practices, many of them through the agency of the advertisements in the *British Medical Journal*. I hope they all realize that the creation of the proposed Regional Hospital Services Councils, with their power to advise on the appointment to the honorary staffs of hospitals, will destroy the goodwill value of their practices. If the work of the Regional Hospital Services Councils will raise the standard of specialist practice then let it be done, but surely our Negotiating Committee should insist that the Government pay full compensation to those specialists who can prove their practices have a goodwill value.—I am, etc.,

Blackburn. J. M. WISHART.

Reallocation of Medical Man-power

SIR,—May I, as one of the E.M.S. doctors referred to by Surg. Lieut. J. L. Adlington (*Supplement*, March 3, p. 33), say how much I agree with the sentiments he expresses regarding the reallocation of medical man-power. Many of us obtained our higher qualifications before the war started and have been volunteers for the armed Forces since the beginning of hostilities, but have been held back by local authorities and other bodies.

Life for us has not been as easy as he makes out. We have had our share of civilian war surgery, and have played our part in the treatment of casualties from Dunkirk, Dieppe, and Normandy. The work and responsibility of the civilian sick have increased with each year of the war. In my own case, working as the only surgeon in a municipal hospital of 600 beds, I operated last year upon over 1,100 cases and was responsible for their pre- and post-operative treatment without the help of an assistant or a house-surgeon. In addition I ran my own surgical out-patient department, where I saw over 700 new cases last year. My duties also include lectures to student nurses, and I have to take my place in rota two or three times a week on night call to examine and treat medical, mental, and chronic sick cases and to give anaesthetics in the maternity department. I have now resigned my appointment and I await with pleasure my call-up to the armed Forces.—I am, etc.,

HAROLD PARK.

Agreements for Purchase of Practices

SIR,—I venture to submit suggestions for reducing the dangers of doctors defaulting in practice purchase agreements.

1. Rigid rates of repayment should not be exacted from a man with a variable income. Repayments of amounts related to the income tax payable and to the rate of income tax would be much fairer.

2. Heavy life insurance premiums should not be paid during the interest-paying period as these prolong that period. Life insurance for the balance of the debt should be sufficient.

3. Practice, house, car, furniture, and instruments should be purchasable under one hire-purchase loan agreement.

4. Such hire purchase by doctors should be financed and insured by a doctors' semi-benevolent society, capable of receiving gifts, legacies, guarantees, and interest-free loans. The name of such a society might well be "The Doctors' Protection Society."—I am, etc.,

Bombay. WILLOUGHBY CLARK.

War Gratuities

SIR,—It is difficult to see how the anomaly mentioned in Wing Cmdr. R. W. Durand's letter (*Supplement*, March 3, p. 33) can be remedied. Raising "B's" gratuity would give non-medical officers and men a legitimate grievance, while if all gratuities were raised to an equivalent level the bill would be considerable. Reducing "A's" gratuity will not help "B," and would be a flagrant breach of contract. Finally both "A" and "B" had an equal chance of getting a short-service commission before the outbreak of war.—I am, etc.,

C. J. ROBARTS,
Surg. Lieut.-Cmdr., R.N.

SIR,—It is surprising that so little comment has appeared in your correspondence columns on the subject of the proposed gratuities offered to medical officers on discharge from the Services. In a sense the word "gratuity" seems a misnomer, since it implies an *ex gratia* payment made in addition to substantial other emoluments. Surely a gratuity should rather be regarded as a compensation for hardship and loss of pension-producing years of civil employment.

MEDICAL SERVICES IN THE UNITED STATES

Medical care in the United States is largely privately supported and privately directed. Apart from the tuberculosis, infectious diseases, and mental health services the Federal Government has provided medical care only for the needy. It is estimated that there are over 8,000 clinics where doctors devote often half of each day to patients unable to pay for their services, while two-thirds of the hospital beds in the country are free beds in public or voluntary hospitals. Recent surveys have shown, however, that adequate medical care is not available in sparsely populated districts and for persons in the lower income groups. Doctors are much more numerous in some States than in others; Massachusetts has almost three times as many doctors per person as Mississippi. Doctors and hospitals are heavily concentrated in urban centres: there are more than 1,000 counties in the U.S. with no general hospital. These surveys have also shown that only persons in the middle and higher income groups can avail themselves fully of private medical and hospital attention. The Committee on the Cost of Medical Care for the American People found in 1932 that families in the higher income groups received three times as much medical attention as the needy.

The result has been that private insurance companies offer cover to thousands of industrial workers against the costs of medical and hospital care, while many business organizations have their own schemes for their employees and their dependants, the cost of which is usually, though not always, shared by employer and employees. Then there are schemes sponsored by State or county medical associations, the largest of which, the Michigan Medical Service, has 500,000 subscribers, but covers costs of surgical treatment only. Members of the "Blue Cross" organization, who number about 12,000,000, receive hospital benefits for a payment of 3 cents a day. In 1937 some 1,500 Government employees in Washington formed the Group Health Association, which provided complete medical care for all its members. A farming community in Oklahoma built a hospital of 85 beds and to-day 1,600 families each pay 25 dollars (£5) a year for complete medical and hospital treatment. In all about 20,000,000 people in the U.S. are covered by these and other schemes of voluntary sickness insurance.

A Medical and Hospital Insurance Bill

In June, 1943, Senators Wagner and Murray and Representative Dingell introduced a bill into Congress which aimed at extending the existing Social Security Law to include a Government system of medical and hospital insurance. This met strong opposition and has not become law; it is still under discussion. Under it each worker and his dependants would be entitled to the services of a physician whom he could choose from among those who had voluntarily agreed to enter the scheme. Each person would be entitled on his doctor's advice to specialist, consultant, and laboratory and related services, including *x*-ray investigation, special appliances, eye-glasses, etc., and necessary hospital care, the latter being limited to a maximum of 30 days in any year, although it might be extended to 90 days if the insurance fund can support it. Doctors would be free to enter or remain outside the scheme, and to accept or reject patients. They would be paid by: (*a*) fees, (*b*) capitation payment, (*c*) salary, whole- or part-time, or (*d*) a combination of these. Every hospital would be eligible to participate. Employed persons would contribute 6% of their wages or salary and employers a corresponding amount. In the case of employees of States or municipalities the contribution from each would be 3½% of wages. A higher rate of contribution is suggested for people in business on their own account, but wages or earnings over £600 a year would not be considered in computing these deductions.

The United States Public Health Service would be responsible for the administration of the professional and technical aspects of the scheme under the Surgeon-General, finance being the province of the Social Security Board. Rules and regulations would be issued by the Surgeon-General in consultation with the Social Security departments; he would enter into contracts with doctors and hospitals and set up appeal organizations. There would be an advisory council to the Surgeon-General, known as the National Advisory Medical and Hospital Council. The chairman would be the Surgeon-General, who would appoint the 16 members from panels of names submitted by professional and other organizations concerned with medical services and education. Each member would hold office for four years and would be paid $25 a day while attending meetings plus travelling expenses. This council would advise on all professional and hospital standards, on methods of payment, grants-in-aid of education and research, the establishment of special committees, etc. As our contemporary the *Canadian Medical Association Journal* puts it: "Perhaps the most significant point in this plan is the very great power placed in the hands of the Surgeon-General. Neither in Canada nor in Great Britain is it proposed to give such authority to any one man."

What the A.M.A. Thinks

Strong opposition to Government activity in the medical field has come from the American Medical Association and the National Physicians Committee, the latter a committee of prominent doctors organized to promote the extension of medical care by private rather than Government action. Dr. Morris Fishbein has said that the Wagner-Murray-Dingell Bill is "political medicine," that it would eventually mean Government control of all medical practice, and that the American Medical Association is working on its own programme for a "better distribution of medical services." At the end of 1943 the American Medical Association published a "Statement of General Policies" in which, after expressing the view that it is "not in the public interest that the removal of economic barriers to medical service should be utilized as a subterfuge to overturn the whole order of medical practice," it makes the following statement on health insurance: "The Association approves voluntary prepayment medical service under the control of State and county medical societies in accordance with the principles adopted by the House of Delegates in 1938. The medical profession has always been strongly opposed to compulsory health insurance, because: (1) it does not reach the unemployed class; (2) it results in a bureaucratic control of medicine and interposes a third party between the physician and the patient; (3) it results in mass medicine which is neither art nor science; (4) it is inordinately expensive; and (5) regulations, red tape, and interference render good medical care impossible."

While recognizing the big cost involved, the supporters of the Bill say that the additional services are socially necessary and that the cost would be spread more evenly. Among its most vigorous defenders are the American Federation of Labour, the Congress of Industrial Organizations, and the Committee of Physicians for the Improvement of Medical Care, a group of doctors organized to support a Government health insurance programme. Public opinion on the subject is divided. A survey indicated that 42% of those familiar with the Bill are opposed to it and 32% in favour.

GENERAL MEDICAL COUNCIL

DISCIPLINARY CASES

An extra session of the General Medical Council, principally to deal with penal business postponed from the session of November last, was opened on Feb. 27, Sir Herbert Lightfoot Eason presiding.

Prof. Henry Cohen, a member nominated by the Privy Council, and Prof. W. J. Tulloch, representative of the University of St. Andrews, were introduced and took their seats.

Charges relating to Certification

The first case considered was that of Madhavrao Narayan Agascar, registered as of Mexborough, Yorkshire, L.M.S.Bombay, who was summoned on the charge of having given on various dates in 1943 and 1944 a number of untrue, misleading, and improper certificates concerning employees of an undertaking engaged in essential work. Eleven certificates relating to six individuals were mentioned in the charge. The complainants were the Manvers Main Collieries Ltd., who were represented by Mr. J. B. Herbert, counsel; the respondent attended and was accompanied by Mr. A. Pereira, counsel.

Mr. Herbert said that Manvers Collieries operated a number of workings near Mexborough, employing some 4,000 men. Dr. Agascar had carried on for a long time a large industrial practice in Mexborough as assistant to Dr. Bhatia. Some of the certificates in question were given for the purposes of the administration of the Essential Works Order. The employer in certain scheduled undertakings was bound to pay a guaranteed wage to every man in the undertaking, and if it happened that on a particular day there was no work available for a man, he was still entitled to receive payment for that day provided he was ready and willing to work for the remainder of the week. If there was satisfactory evidence of sickness or disability on these other days he was still entitled to payment, but if no such evidence could be given, payment was not made. Mr. Herbert was not in a position to call any of the workmen to say that they went to Dr. Agascar when they were not ill and got certificates; he was bound to rely on surrounding circumstances which made it a very remarkable thing that these certificates should have been issued.

On Sept. 9, 1943, three certificates were given for three men that they were unable to follow their employment because of influenza. These men were members of a

In peacetime the short-service medical officer receives a substantial gratuity on completion of his service, presumably to bring him on to an equal footing with regular officers of the Services, who are pensioned on retirement. At the end of the present war, however, medical officers, volunteers or otherwise, are offered a gratuity entirely out of proportion to this peacetime amount. The effect of this is that non-regular officers are penalized by comparison with regular officers, who have accumulated years towards their pensions during the war. Moreover, these gratuities are very much less than those given after the last war, and it is interesting to note that the total figure quoted as the cost to the nation of all gratuities is very much less than in 1918, although many more individuals have served in the Forces and for a longer time.

It is unnecessary to touch upon the financial hardships necessarily and for the most part uncomplainingly borne by medical officers on account of their service, and it seems only reasonable that a gratuity given on its completion should be substantial enough to be a really useful aid in professional rehabilitation, and enough to compensate them for the loss of years during which they might have been qualifying for a pension or saving against the years to come.—I am, etc.,

WING COMMANDER.

The Earl of Harewood, who presided at the annual meeting of the Royal Baths Hospital, Harrogate, on March 10, said that a campaign started just before the war to put the hospital on a first-class basis had aimed at £70,000, and rather more than half of that was raised in the first year of the appeal. A plan to carry out the whole of the improvements desired would need consideration in the light of the Government's White Paper on hospitals and health services. Lord Harewood went on to recall that the Royal Baths Hospital had initiated a research department jointly with Leeds University, which still had money to its credit to revive that scheme after the war. Research into the causes and cure of rheumatism must be one of the most important of objects, and the Government ought to give great encouragement to this if it took the work of hospitals seriously. Proceedings in Parliament, and legislation in particular, should be watched to see that hospitals retained their liberty of initiative in research work. "None of the adventures in research work since the war," Lord Harewood continued, "and there have been many, would have been effective if hampered by bureaucratic ordinances, and it is the same in research into rheumatic diseases. I hope you will use such influence as you have to let the research worker use his own brain unhampered by restrictions which red tape and bureaucracy have been apt to put on." Mr. Herbert Crowther, who was re-elected chairman of the board of management, said it was impossible to think of the national health services without the treatment of rheumatic diseases in specialized hospitals. The board was anxious that Harrogate should become the regional centre for the treatment of rheumatism in the north-east of England, and all the hospital's facilities would be placed before the Government on any agreed scheme. With the co-operation of Leeds University and Leeds Medical School, and with some increase in the medical staff, the Royal Baths Hospital was ready to accept full responsibility under the national health services.

SPECIAL REPRESENTATIVE MEETING

Notice is hereby given that on the requisition of the Council a Special Representative Meeting of the British Medical Association will be held in the Great Hall, B.M.A. House, London, W.C.1, on Thursday, May 3, at 10 a.m., continuing until the business is completed. The meeting is expected to last until the evening of Friday, May 4. The business of the meeting is to consider a report from the Council on the negotiations which have been proceeding with the Minister of Health and to determine the Association's policy on the issues raised.

By order of the Chairman of the Representative Body.

CHARLES HILL,
Secretary.

B.M.A. House, Tavistock Square,
London, W.C.1.
March 31, 1945.

CONSULTANT AND SPECIALIST OPINION

A further meeting open to consultants and specialists (see *Supplement,* March 3, p. 34) has been arranged as follows:

Exeter.—Wednesday, April 11, at 3.30 p.m., in the Board Room of the Royal Devon and Exeter Hospital. Dr. C. J. Fuller will open the discussion.

H.M. Forces Appointments

ARMY

Major A. L. Sheppard, I.M.S., retired pay, has been restored to the rank of Lieut.-Col. on ceasing to be re-employed.

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. M. B. King, M.C., having attained the age for retirement, is retained on the Active List (supernumerary).

Short Service Commission.—War Subs. Capt. A. C. S. Hobson, M.C., from Emergency Commission, to be Lieut., and to be Capt.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Col. R. E. Bickerton, D.S.O., T.D., has relinquished the appointment of Hon. Col., R.A.M.C. Units, the London Division, on completion of tenure.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capts. C. B. Armitt, I. A. Tumarkin, and W. O'Brien have relinquished their commissions on account of disability, and have been granted the honorary rank of Major.

War Subs. Capts. J. Cantlie, B. Oppenheim, E. P. Scott, and G. R. Sedleigh-Denfield have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

War Subs. Capt. D. W. Montgomery has relinquished his commission on account of disability, and has been granted the honorary rank of Capt. (Substituted for the notification in *Supplement* to the *London Gazette* dated Feb. 6.)

To be Lieuts.: I. Grebler and E. H. R. Smithard.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

War Subs. Capt. (Mrs.) E. J. Parry has relinquished her commission.

(Mrs.) Inez M. Y. M. Petrie and (Miss) Hope Trant, M.B.E. (Emergency Appointments), to be Relative Lieuts.

ROYAL AIR FORCE

ROYAL AIR FORCE VOLUNTEER RESERVE

Fl. Lieut. L. G. Maclachlan has relinquished his commission on account of medical unfitness for Air Force service.

WOMEN'S FORCES

EMPLOYED WITH THE MEDICAL BRANCH OF THE R.A.F.

Fl. Lieut. B. B. Lennon has resigned her commission.

Constance L. Simpson to be Flying Officer (Emergency).

COLONIAL MEDICAL SERVICE

The following appointments have been announced: G. D. Arthur, M.R.C.S., Medical Officer, Falklanc Islands; V. L. Billington, Medical Officer, Nigeria S. Forrest, M.B., Assistant Director of Medica Services, Tanganyika; G. Kinneard, O.B.E., M.D. Director of Medical Services, Fiji; L. A. P. Slinger M.B., Senior Medical Officer, St. Lucia; G. W Green, M.D., Medical Officer, Nigeria; S. Bodissian M.D., Medical Officer, Grade 1, Palestine.

MEDICAL WAR RELIEF FUND

BIRTHS, MARRIAGES, & DEATH

The charge for an insertion under this head 10s 6d. *for* 18 *words or less. Extra words* 3s. 6 *for each six or less. Payment should be forward with the notice, authenticated by the name a permanent address of the sender, and should rea the Advertisement Manager not later than first po Monday morning.*

BIRTH

ULYATT.—On March 19, 1945, at Shardeloes, Ame sham, Buckinghamshire, to Dr. Frances Margar Ulyatt (*née* Douglas) and Flying Officer Kenne Ulyatt, R.A.F.V.R., a son—Charles Kenneth.

MARRIAGE

ROLLASON—ROWBOTHAM.—On March 3, 1945, St. Andrew's Church, Banwell, Fl. Lieut. Willia Norman Rollason, R.A.F.V.R., Holly Ha Worcs., to Margaret Rowbotham, of Banwe Somerset.

DEATH

WEBSTER.—Killed on active service on Feb. 20, 194 Fl. Lieut. Ralph Webster, R.A.F., dearly lov only son of Lieut.-Col. and Mrs. W. J. Webst Kasauli, Punjab.

team of eight in a particular seam. A fall occurred in the seam and it was intimated that they would have to work somewhere else, whereupon all these eight men reported sick and did not turn up at the colliery until two days later, by which time it was possible for work on the old seam to be resumed. Three of these men presented the certificates which figured in the charge. The circumstance that they all fell ill on the same day and recovered on the same day seemed suspicious, but the extraordinary thing was that the events were repeated almost exactly six months later, when three other men were similarly certified all on the same day to be unable to follow their employment because, respectively, of rheumatism, synovitis, and influenza.

In another case a man was certified as having had an injury to his left hand. This man was ordered by the management on Feb. 12 to undertake a night shift, when he was normally on day shift, and he did not turn up. On Feb. 24 he was interviewed by the Pit Production Committee as to the cause of his absence; he did not produce any certificate, but on the following day he turned up with a certificate by Dr. Agascar, bearing the date Feb. 13. The number of this certificate was F.1586, but the company had in its possession a certificate issued by Dr. Agascar to another person dated Feb. 24 which was numbered F.1588, and it was suggested therefore that Dr. Agascar must have issued the challenged certificate on or about the 24th and have dated it back to the 13th. Another man was away from his work on several days in January and February and was sued for damages by his employers in respect of his absenteeism. He thereupon produced N.H.I. intermediate certificates dated respectively Jan. 20 and 27 and Feb. 3, but the numbers of these certificates were consecutive—namely, E.646671–2–3. Counsel submitted that this man must have obtained all three certificates from Dr. Agascar on the same date, although on each certificate he had declared, "I have examined you on the undermentioned date," thus covering three weeks of his absenteeism. Evidence was given by the manager of the collieries and other officials concerning procedure on certificates.

Mr. Pereira submitted that there was no case to answer. No counter-evidence had been given as to the health of the men concerned at certified dates.

The Council, after deliberating in private, decided that there was a case to answer.

Mr. Pereira then said that in the circumstances he would take the responsibility of asking Dr. Agascar not to go into the witness box. No medical man should be put in peril on such evidence as had been produced. Here were certificates by a qualified medical man that these workmen were suffering from certain illness or disability on given dates, and no evidence, medical or other, as to the health of these men had been called to challenge them. There were any number of possibilities to account legitimately for the circumstances stated to be suspicious. It would have been quite feasible to have made independent inquiries as to where these men were and what they were doing during their absence from work, but no such steps had been taken by the management of the collieries. As to the fact that certificates on widely separated dates bore consecutive numbers, this might be due to the fact that more than one book of certificates was in use at the same time.

A number of testimonials were put in on behalf of Dr. Agascar.

After a short private deliberation the Council found that the facts alleged against Dr. Agascar had not been proved to its satisfaction.

In view of this decision Mr. Herbert withdrew a charge against Dr. Sukhdev Pershad Bhatia, registered as of Mexborough, who had been summoned on a complaint by the Manvers Collieries based on similar allegations to those brought forward in the case of Dr. Agascar.

Unlawful Procurement of Dangerous Drugs

The Council considered the case of Francis Christopher Toner, registered as of Galway, who appeared in answer to a charge that he had been convicted of offences under the Dangerous Drugs Act.

Mr. Winterbotham, the Council's solicitor, stated that the offences fell into four groups. In February, 1936, Dr. Toner was convicted at Clerkenwell police court of failing to enter in a register particulars of various purchases of drugs. He was fined and his authorization to obtain drugs was withdrawn by the Home Secretary. In January, 1943, at Wealdstone petty sessions, Dr. Toner was convicted on four charges that, not being duly authorized, he had unlawfully procured for himself quantities of dangerous drugs, and he was sentenced to four concurrent terms of six months' imprisonment. In June, 1944, at North London police court, he was convicted on four charges of unlawfully obtaining morphine sulphate tablets, and was sentenced to four concurrent terms of six months' imprisonment. Shortly before the date of these last convictions Dr. Toner had become friendly with a State-registered nurse employed by the L.C.C., and while visiting her at the hospital persuaded her to obtain morphine tablets for him from a drug cupboard on the promise to return them next day. He did return certain tablets on the following day, but they were not morphine sulphate. His last conviction was at Lincoln in February, 1945. Here there were four charges of unlawfully procuring tincture of opium diluted. He was at that time engaged as locumtenent at a dispensary at Lincoln, and during that period he stole 144 morphine suppositories from the locked drug cupboard. This offence was taken into consideration, and he was committed to prison for twelve months without hard labour, which sentence he was still serving.

Dr. Toner had written to the Council expressing his deep regret and stating that the offences had never involved any patient. In his professional capacity he had not used any of the drugs in question. He added that he felt sure that as a result of the imprisonment he was serving he would be completely cured of the drug habit. A letter from the medical officer to Lincoln prison was read in which he gave a good account of Dr. Toner's condition. Dr. Toner added that it was entirely incorrect that the tablets which he returned to the L.C.C. hospital were not of morphine sulphate, similar to what he had taken the day before. He could prove this if necessary.

The Council found that the facts had been proved, and directed the Registrar to erase the name of Dr. Toner from the *Medical Register*.

The Council next considered the case of David Davidson Watson, registered as of Colquhoun Street, Stirling, who appeared on the charge that he had been convicted on Sept. 14, 1944, at the Sheriff Court at Stirling, of procuring for himself drugs or preparations to which Part III of the Dangerous Drugs Act, 1920, applied, and of procuring for other persons by means of prescriptions like drugs or preparations. He had been fined £50 or three months' imprisonment.

Mr. Winterbotham said that Dr. Watson, after his authorization had been withdrawn, had issued prescriptions for morphine and cocaine on numerous occasions; eighty-nine prescriptions for morphine and twenty-six for cocaine were in question. The usual prescription was for morphine sulphate 4 gr. solution in water, and Dr. Watson, when charged with the offences, explained that in his view this solution did not come within the provisions of the Dangerous Drugs Act. The fact was, said Mr. Winterbotham, that the Act of 1920, Part III, sect. 8 (1), applied to "morphine, cocaine . . . and any preparation, admixture, extract, or other substance containing not less than one-fifth per cent. of morphine or one-tenth per cent. of cocaine, ecgonine, or diamorphine. For the purpose of the foregoing provision the percentage in the case of morphine shall be calculated as in respect of anhydrous morphine." These prescriptions would barely fall within the terms of the original Act, but by the Act of 1932 a new section was substituted for sect. 8 (1), which made the Act apply to "any solution or dilution of morphine or cocaine or their salts in an inert substance, whether liquid or solid, containing any proportion of morphine or cocaine. . . ." The alteration of the Act provided that any solution of morphine or cocaine in an inert substance was a dangerous drug. Dr. Watson had twice previously been before the Council, the first time in 1936 on a conviction of driving a motor-car while under the influence of drink, and on the second occasion in 1938, arising out of a conviction of manslaughter and driving a motor-car while under the influence of drink. On the second occasion his name was ordered to be erased, but it was subsequently restored.

Dr. Watson, on his own behalf, said that he had believed that a preparation containing only one-tenth per cent. of morphine did not come under the Dangerous Drugs Act, and he spoke of the difficulties in practice which arose out of the withdrawal of his authorization by the Home Secretary. He submitted a letter by Dr. A. J. Shedden of Stirling, stating that Dr. Watson had been his assistant since 1942, and he had found him honest, industrious, and painstaking, and well received by his patients. Dr. Watson wished to give up general practice and specialize in mental diseases, in which he had been greatly interested, and he should do well.

The Council found the conviction proved. The President said that this was not the first time Dr. Watson had appeared before the Council, and from the Council's point of view his record was not a very satisfactory one. In order to give him an opportunity of reconsidering his behaviour in these matters the Council had decided to postpone judgment for two years.

Driving Car under Influence of Drink

The Council considered the case of Alexander Lawrie, registered as of Accrington, who appeared on the charge that he had been convicted on two occasions, both in August, 1944, one of driving a motor-car while under the influence of drink, and the other of being under the influence of drink to such an extent as to be incapable of having proper control of a motor-car; and also the case of Christopher Whitehead, registered as of Greystone, Co. Wicklow, who appeared on the charge that he had been convicted in May, 1944, of driving a motor-car while under the influence of drink.

In both cases the convictions were proved, but judgment was postponed for two years.

Prof. R. J. Brocklehurst was appointed by the Council a member of the Dental Board.

The Council completed its session in two days.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY APRIL 7 1945

HEARD AT HEADQUARTERS

"Confidential"

The best means of ensuring publicity is, t appears, to make every endeavour to keep a thing quiet. If you want somehing shouted from the house-tops you must whisper it in the street below. The rouble is that in the process of transmission the story is liable to undergo changes, to be exaggerated here and diminished there, so that in the end it s almost unrecognizable. That is a reflection prompted by the accounts in some, not all, of the newspapers on the new White Paper "proposals." Actually there are no new proposals; there are certain possible changes on which the bodies negotiating with the Government the Negotiating Committee for the medical profession is not the only one; here are others concerned for the hospitals and the local authorities) are seeking the views of their constituents. There is nothing sinister about the fact hat the document which forms the basis of this consideration is marked "not for publication"; it was only a question of following, at the wish of the Government, a certain constitutional procedure which governs such matters before they are laid on the table of the House of Commons. To talk of "victories" for this or that section is beside the point; this is not a military engagement but a topographical exploration—almost literally topographical since it has to do with areas and egions and central and local administration. It was agreed that this province of administration should be the first to be studied, and only upon a result acceptable o the profession in this respect being reached would the negotiations go further.

Without any love for red tape or departmental circumlocution, one can understand the disinclination of the Government to have it go forth that crystallized proposals have been made, when all that is in question is tentative nvestigations to discover what body of assent might be forthcoming if certain changes were made.

The 100% Issue

The Representative Body at its special meeting at the beginning of May will be asked to make up its mind on the 100% ssue. Hitherto, quite properly, it has reserved its opinion until the negotiations which it authorized had proceeded a cerain distance and it was possible to discern more clearly the shape of things to come. On this question it can be said with definiteness that there has been no negotiation with the Government. But there comes a time when a decision, hitherto properly deferred, must be taken. t would be foolish if the profession waited until the Government's proposals, with many details agreed, were submitted to Parliament, and then dug its feet in and refused service on a major ground of principle.

One question which the Representative Meeting will have to face is whether it is willing for terms and conditions for a 100% service to be negotiated, subject to the introduction of firm safeguards, or, on the contrary, whether it is prepared to show how a complete service, including all facilities, can be provided in some satisfactory way with a certain proportion of the population outside.

The National Eye Service

The draft scheme for a National Eye Service (which proposes that a medical specialist shall be responsible for every patient, but that he shall be allowed to use the technical skill of selected opticians in refraction work) was taken a stage further at a meeting of the Ophthalmic Group Committee of the B.M.A. the other day, and now it goes to the Council with a recommendation for adoption. The scheme has been discussed at eight regional meetings in various parts of the country, and the conclusions reached were patiently considered by the Group Committee line by line and section by section, and some of them embodied in the document. The first of these, on a proposal from Leeds, was to add to the preamble of the scheme a statement that the scheme is based on the assumption that ophthalmology will continue to be an integral and co-equal part of the general plan for the future hospital services of the country. That being the case, to meet the problem of mass ophthalmic work considerable extension of present facilities will be necessary. Hospital departments will have to be enlarged, satellite clinics created, and present clinics serving local needs maintained. Many of the other changes were only slight adjustments of wording, but the scheme ought to be, on paper, as perfect as a scheme can be, in view of the careful revision.

Not a Parallel

We have had a sight of the second report of the so-called Beveridge committee of the sight-testing opticians. In putting forward a claim for "optical practitioners" in the National Health Service it institutes a parallel between the sight-testing optician and the dentist. The dentist, it says, without a medical qualification and working without medical supervision, not only diagnoses disease conditions but also carries out treatment within his sphere. Surely this comparison goes too far. Everyone knows the exacting and prolonged training of the dentist, which parallels medical training very closely, and the stringent examination before the dental student is admitted to a practice which is even more exclusive than medicine (for any unqualified practice in dentistry is a breach of law). As for the educational curriculum of the optician, there has been, so far as we know, little change since 1927, when a Departmental Committee in its majority report stated: "We feel obliged to say that we are not satisfied that there is any training for opticians sufficiently thorough to avoid the danger which is involved in the possession of a little medical learning." The report went on to say that the majority were satisfied "that none of the teaching provides anything in the way, not merely of general medical training, but of specialist medical training pertaining to the eye which is comparable to the training required of a medical practitioner"—or, let us now add, of a dental practitioner. This is not to say, of course, that the technical training for opticians at the best schools may not be excellent, only that the part of it which deals with pathological conditions of the eye is quite inadequate, and must be so if it is not associated with a regular medical training.

The Askwith Agreement

The B.M.A. Council agreed, without discussion, that the prescribed notice of one year should be given on April 1 to terminate the Askwith agreement. The Askwith agreement relates to the salaries of whole-time public health medical officers. The Society of Medical Officers of Health, with which the Association has always acted since the Askwith memorandum was drawn up sixteen years ago, requested that the Association should give the year's notice to the local authorities associations concerned, as it is making proposals which will presently be put forward concerning salaries and gradings. A further consideration is that if the Spens Committee on Remuneration establishes that there is a large body of public health medical officers in the £500–£700 scale (and the great majority of whole-time officers are in that category) it might be inferred, in the absence of proposals for modification, that there is no dissatisfaction with the existing pay, and wrong conclusions might be drawn.

The Late President

Among the messages of sympathy received at B.M.A. Headquarters on the death of the President, Lord Dawson of Penn, have been a cable from the Victorian Branch sent by the President, Dr. John Dale, of Melbourne, and a telegram of condolence from the President and Council of the Southern Branch, sent by the honorary secretary, Dr. John Clayre.

Correspondence

A Warning Debate in House of Commons

SIR,—The debate in the House of Commons on teachers' salaries (Feb. 20) offers, I submit, material for reflection for the medical profession. It became apparent in the course of the debate that the scale of salaries for teachers had been arranged by a committee operating in secret session and consisting of (1) representatives of the teachers and (2) representatives of local authorities. It became abundantly evident during the debate that the effect of the proposed scales must inevitably be to discourage better-qualified teachers from taking appointments in the national schools which are to result from the provisions of the Education Act. Confronted with this development it was explained by the Minister and by the spokesman in the House for the Burnham Committee that the decision was the responsibility not of the teachers, who opposed it and were outvoted by the local authorities forming part of the committee. This statement was supported by quotations purporting to be extracts from the minutes of the committee, which, it was pointed out in the debate, are not open to examination by the House.

The Burnham Committee award received the official support of the Labour Party, and the front-bench spokesman for that Party revealed a curious but significant attitude in his argument that the resources of the nation are like a honey-pot surrounded by flies, and that it is the duty of Government to see that the contents of the honey-pot are equitably distributed among those wishing to partake of it. Incidentally and quite irrelevantly the doctors were stigmatized as a section claiming an undue share! The almost unanimous resistance of the medical profession to its future control by local authorities will, I hope and believe, be materially strengthened by the incidents of this debate.—I am, etc.,

House of Commons. E. GRAHAM-LITTLE.

Evidence of Incapacity

SIR,—In the *Supplement* of Feb. 24 (p. 27), "Heard at Headquarters," your contributor makes two statements which are open to question. (1) He refers, I assume him to mean, to the patient's own doctor as neutral. I doubt if general practitioners who only hear the patient's own story can ever be quite impartial; they must be, if ever so slightly, pro patient, and rightly so. But the patient, and particularly the doubtful customer, regards him as very definitely pro patient and takes immediate offence if his word is doubted. (2) He also quotes the testimony of a member of the General Practice Committee that 99% of work-people in such cases are trustworthy. This shows a delightful faith in the integrity of his patients, but is not confirmed by my own observations as a general practitioner or as a part-time works doctor; nor do I think it likely to be endorsed generally throughout the country. I agree that the percentage is a small one, but the important fact is that this small percentage cause a vast amount of unnecessary work to both employers of labour and the medical profession generally, and I am not convinced that the present method of referring doubtful cases to independent medical referees has been of much help.

This problem of certification is an urgent one; it is clearly aggravated in wartime, but it is a serious barrier to successful negotiations for a National Health Service. Fitness or unfitness for work is all too frequently one of the most difficult decisions that a doctor has to make, and he must in many cases be guided by his patient's opinion. This fact involves the good faith between doctor and patient which is an integral part of the true doctor–patient relationship. The Chairman of Council rightly emphasizes that there must be no interference in a future National Health Service with this relationship, but I am sure he must realize fully that the problem of certification does in certain quarters cast a cloud and creates a desire to exercise some form of control over this relationship which would not be acceptable to the profession.

It is my view that this problem of certification is our problem and only we ourselves can solve it. The method adopted in the National Health Insurance of referring patients to Regional Medical Officers appointed by the Ministry of Health, who had no further information or knowledge of the patient than the original medical certifier, was most unsatisfactory to all concerned. This method has been continued in the solving of industrial medical problems, with like unsatisfactory results. It is not the purpose of this letter to indicate alternative methods, but I respectfully suggest that this period of negotiation is a most suitable time for the Council of the B.M.A. to consider fully the difficulties of certification in general practice, and, at an opportune time, offer a solution of a problem which must be giving the Minister of Health some anxious moments.—I am, etc.,

Birmingham. R. C. L. BURGES.

BRITISH MEDICAL ASSOCIATION

Formation of Burton-on-Trent Division

Notice is hereby given by the Council of the Association to all concerned that it has formed a Burton-on-Trent Division of the Association, the area to be conterminous with the County Borough of Burton-on-Trent; Tutbury Rural District; Swadlincote Urban District, the new Division to come into existence as from the date of this notice, and to form part of the Staffordshire Branch.

CHARLES HILL,
March 11, 1945. *Secretary.*

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1) Week-end course in rheumatism at St. Stephen's Hospital, all day, Sat. and Sun., March 24 and 25; (2) Revision course in anaesthetics at various London hospitals, all day, April 9 to 21; (3) Final F.R.C.S. demonstrations and courses as follows: Clinical demonstrations at Metropolitan Hospital, March 21 and April 18, 5 p.m.. Clinical demonstrations at St. Mary Islington and Archway Hospitals, Weds., March 21 and 28, Tues., April 3, and Wed., April 11, 2 p.m. Week-end course in surgery at Hillingdon County Hospital, all day, Sat. and Sun., April 14 and 15. Demonstration of selected cases at London Homoeopathic Hospital, Sat., April 21, 2.30 p.m.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*West End Hospital for Nervous Diseases:* Mon., Tues., Fri., 2.30 p.m., Course in neurology (suitable M.R.C.P.). *Radcliffe Infirmary:* Daily, Revision courses in anaesthetics. *London Homoeopathic Hospital:* Wed., 5.30 p.m., Final F.R.C.S. surgery demonstrations.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—Oliver-Sharpey Lectures by Dr. B. H. C. Matthews: *Tues.*, 4 p.m., Effects of High Altitude on Man; *Thurs.*, 4 p.m., Effects of Mechanical Stresses on Man.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—Lectures on Applied Physiology by Prof. John Beattie: *Mon.*, 2.30 p.m., Physiological Problems in Head Injuries; *Wed.*, 2.30 p.m., Physiology of the Autonomic Nervous System; *Fri.*, 2.30 p.m. Recent Advances in the Physiology of Anaesthesia. Lectures on Anatomy by Prof. A. J. E. Cave: *Mon.*, 4 p.m., the Cerebrospinal Fluid; *Wed.*, 4 p.m., Tonsillar Masses of the Alimentary Canal; *Fri.*, 4 p.m., Anatomy of the Pancreas.

ROYAL SOCIETY OF MEDICINE.—*Tues.*, 2.30 p.m., Section of Psychiatry; 5 p.m., Section of Experimental Medicine and Therapeutics. *Wed.*, 3.30 p.m., Section of Proctology; 4 p.m., Section of Physical Medicine. *Thurs.*, 5 p.m., Section of Dermatology. *Fri.*, 5 p.m., Section of Obstetrics and Gynaecology; 6 p.m., Section of Radiology.

BIOCHEMICAL SOCIETY.—At Middlesex Hospital Medical School, W., *Sat.* (March 17), 2 p.m., Annual general meeting.

BRITISH INSTITUTE OF RADIOLOGY, 32, Welbeck Street, W.—*Thurs.*, 8 p.m., Mr. L. Dudley: Stereoscopic Photography and Radiography.

CHADWICK TRUST.—At London School of Hygiene, Keppel Street, W.C., *Tues.*, 2.30 p.m., Mr. Albert Parker: Atmospheric Pollution.

FACULTY OF RADIOLOGISTS: DIAGNOSIS SECTION.—At Royal College of Surgeons of England, Lincoln's Inn Fields, W.C., *Fri.*, 2.30 p.m., Discussion: Non-malignant Conditions of the Oesophagus. Openers, Drs. A. S. Johnstone and R. A. Kemp Harper.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street, W.—*Mon.*, 5 p.m., Discussion: Modern Methods of Treatment in Psychiatry. To be introduced by Dr. E. B. Strauss, Dr. L. C. Cook, and Mr. Wylie McKissock. A film will be shown by Dr. Eliot Slater and Dr. William Sargant demonstrating the technique of convulsion therapy.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, W.—*Wed.*, 3.30 p.m., Mr. V. Zachary Cope: Surgery in the Life of To-day.

ROYAL INSTITUTION, 21, Albemarle Street, W.—*Tues.*, 5.15 p.m., Sir Henry Dale, P.R.S.: Adrenaline and Acetylcholine. Adrenergic and Cholinergic Nerves. *Fri.*, 5 p.m., Mr. J. Z. Young: The Structure, Degeneration, and Repair of Nerve Fibres.

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE.—*Thurs.*, 3 p.m., Laboratory Meeting at R.A.M. College, Millbank, S.W.1.

B.M.A.: Branch and Division Meetings to be Held

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle-upon-Tyne, Thurs., March 15, 7.15 p.m., Clinical demonstration in the out-patient department by Dr. D. S. Sutherland and Mr. W. Watts; 8.45 p.m., Address by Dr. Raymond Greene: Mechanism of Endocrine Disorder. Members of H.M. Forces stationed in the area of the Branch are invited.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. *for* 18 *words or less. Extra words* 3s. 6d. *for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.*

BIRTHS

DON.—On Feb. 26, 1945, at St. Mary's Nursing Home, Nottingham, to Eileen Mary (*née* Foord), wife of Dr. Thomas A. Don, a sister for Fiona.

JACKSON.—On Feb. 27, 1945, at the Maternity Home, Scunthorpe, Lincs, to Joan (*née* Broadgate), wife of Major Harry Jackson, R.A.M.C., a sister for John.

ROYSTON.—On Feb. 20, 1945, at Edinburgh, to the wife of Major G. Riddell Royston, R.A.M.C., a son.

STANBURY.—On Jan. 18, 1945, at Astoria Nursing Home, Colwyn Bay, to Helen (*née* Jackson) and Capt. S. W. Stanbury, R.A.M.C. (S.E.A.C.), a daughter.

MARRIAGE

JENNER—IMPEY.—On Feb. 26, 1945, at Sutton Coldfield, S. M. Jenner, Surg. Lieut.-Cmdr., R.N.V.R., to Margaret E. Impey.

DEATHS

McCRACKEN.—On Feb. 22, 1945, at South View, Melrose, late of Newcastle-upon-Tyne, James Smith McCracken, M.D.Ed., in his 83rd year, beloved husband of Mary Jane Mills.

RICHMOND.—On Feb. 26, 1945, at Bryn Hafod, Trefriw, Caernarvonshire, Dr. B. A. Richmond, aged 75 years.

NATIONAL HEALTH SERVICE IN SOUTH AFRICA

RECOMMENDATIONS OF GOVERNMENT COMMISSION

The National Health Services Commission, which was set up by the Government of South Africa towards the end of 1943, has lately reported, and a summary of its recommendations is before us. Some account of the origin of the Commission and of the evidence tendered by the Federal Council of the Medical Association of South Africa (B.M.A.) was given in the *Supplements* of Jan. 1 and 22, 1944.

The Commission recommends the institution of a full range of free personal health services as a "citizen right" for all, the service to be nationally controlled and directed by a Minister of Health responsible to Parliament. It is considered that the Minister should be advised by a National Health Council composed of representatives of the taxpayers, of voluntary organizations interested in health, and of professional and technical interests in the service. This council would concern itself with general policy, while the day-to-day administration would be carried out by a National Health Board of three or five members.

The country would be divided into about twenty regions, and the executive work decentralized so far as possible in the regional organizations, and decentralized again into health centres, of which a total of about 400 throughout the country is contemplated. As advisory bodies there would be democratically constituted councils at both the regional and health centre levels. Other proposals are for a National Health Congress, presumably to meet yearly, to provide opportunities for the staff of the health service to express their views on technical and scientific matters and on service conditions, and for a Health Service Personnel Commission to deal with appointments to the service and other relevant matters. The latter would consist of three members, two of them chosen for their ability to appraise qualifications, and appointed by the Governor-General in Council from a list of names submitted by the National Health Congress, and the third appointed for his knowledge of public service administration and routine.

The Health Centre: South African Version

The 400 health centres would represent about one to every 25,000 of the population. Each centre would be staffed by a number of general practitioners, dentists, and auxiliary personnel, such as health visitors and nurses, all working together as a team. The public would have free choice of doctor from among the staff of the centre, and the doctor so chosen would be primarily responsible for the health of the family. It is suggested that the health centres might undertake periodical medical examinations of the members of the community, also health education. The patient who had to enter hospital would be normally under the care of the centre doctor, but specialists attached to the national service would be available for consultation.

The Commission further recommends that all hospitals should be nationally controlled and completely integrated with extra-institutional and pre- and post-hospital services. Several categories of hospitals are contemplated: university hospitals attached to medical schools, special hospitals, "super-regional" and regional, and general practitioner hospitals. Maternity hospitals would be provided in the larger towns, either as separate institutions or as departments of regional hospitals. Private hospitals would remain until other arrangements can be made to satisfy the demand for free hospital care, and these would be financially assisted, supervised, and inspected by the national health authority. Orthopaedic and tuberculosis hospitals are also contemplated.

It is intended to stress the preventive aspects of public health. Local authorities are to be assisted in the discharge of their non-personal public health duties, and the National Health Service would exercise powers of coercion in case of necessity.

Effect on Private Medical Practice

Private practice is not banned under these recommendations, but if a citizen does not avail himself of the National Health Service he will not be exempt from payment of national health taxation. His position will be the same as that of the parent who, in a country in which free education is provided by the State, sends his children to a private school. After much detail about the financial aspects of the proposals the Commission sets out the following suggested salary scales:

Doctors and dentists (Scale A)[1]	£900-£40-£1,500
,, ,, (Scale B) ..	£1,200-£50-£2,000
Hygiene officers	£400-£25-£800
Pharmacists	£600
Nurses (sisters)	£450-£25-£600

No scales are suggested for specialists, as it is considered that when the scheme is operating specialists would serve their training in the service and would not necessarily command higher emoluments than other medical men in charge of highly important work.

The grand total of more than twenty millions for health services represents an increase of about 50% over the present expenditure. The service is to be financed partly by a contribution from the general revenue, but to a much larger extent by a special health tax. It is said that there is a feeling throughout the country that the service should not be thought to be a charity, and that everyone should contribute, even if only a small amount. Therefore it is proposed that a national health tax be levied on all income groups.

A further recommendation is that a transition committee be set up during the reorganization period. New legislation of a far-reaching character will be necessary. A National Health Act to replace the present Public Health Act will be required to make clear that the State is assuming responsibility for the provision of personal health services for all sections of the people.

Two members of the Commission put forward a minority report. They disagree with the majority in so far as it is contemplated that provincial administrations should play no part in the personal health aspect of the new service, and they are also opposed to the severance of personal from non-personal health service. They consider that in the National Health Service there should be a unified direction in policy, but that the administration and execution of both personal and non-personal service should be in the hands of the four Provinces. The majority propose that the Provinces should surrender to the new Nationa Health Service the control and financia responsibility for all the personal healt services hitherto maintained by them.

In a later article we propose to examin how far the proposals of the Commissio are in accord with the views expresse on behalf of the profession in Sout Africa.

NEGOTIATING A MEDICAL SERVIC

This was the title of an address give by Dr. H. Guy Dain, Chairman o Council of the B.M.A., at a meetin of Nottinghamshire doctors and member of the Committee of the Registered Britis Hospitals Associations at the Genera Hospital, Nottingham, on March 1 Mr. S. A. S. Malkin presiding. Dr. Dai began with a review of the events whic led to the present negotiations. He sai the Government's passive attitude to an official change in medical affairs was galvanized into an active one by Sir Willia Beveridge's report, particularly the latter Assumption B. Discussions between th then Minister of Health, Mr. Ernes Brown, and representatives of the profession failed to achieve any result. Th White Paper on a National Health Service, sponsored by Mr. Willink, opene the next phase. This had been considere by both the Council of the B.M.A. an the Annual Representative Meeting, an their suggested modifications were constructive attempt to implement th entirely admirable preamble of th White Paper. Negotiations so far ha been confined to attempts to reac agreement on the principles which th profession felt should underline th administrative machinery of a healt service.

Dr. Dain then made the followin points: (1) The medical members o the Central Advisory Body should b selected from those nominated by th medical profession. (2) Governmen advisory bodies were not usually give the right to publish their findings, bu such a right was essential for efficien work by the Central Advisory Body. Th Negotiating Committee had taken a fir stand on this issue, and had made th profession's attitude plain. (3) The direction of doctors to the areas in whic they should work was unnecessary. Th Government already had the power t provide for any area in which there wer not enough doctors. (4) So far as h (Dr. Dain) could judge, a unified servic under the Minister of Health coverin all medical work for which the State wa responsible was impracticable, as th various Government Departments refuse to relinquish control of the service the had developed. (5) The problem c regional planning with the universit teaching school as the centre for eac hospital area was being considere (6) Under the new Education Act provision was made for ensuring that the should be adequate professional representation on the appropriate committee The same procedure should hold f committees, both local and central, s up to carry out the health service (7) The position of voluntary hospita was receiving priority attention fro the Negotiating Committee. It w essential that they should retain the voluntary managements and have acce to funds necessary for upkeep an extension.

Finally Dr. Dain reported that he ha asked the Minister of Health for t

---

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY MARCH 17 1945

HEARD AT HEADQUARTERS

A B.L.A. Group

A suggestion for a B.M.A. group or groups of doctors serving with the Forces overseas was very warmly welcomed at a recent meeting of the Association's Organization Committee. Whether the war in Europe is over soon or late, many members of the Association will be in Western Europe and in other fields for some time to come, and the longer they are there the greater need will they feel for such contact as the group system has been found to afford, both for exchange of ideas among themselves and for linking up with the Association at home.

A recommendation is going to the Council that such a group or groups be approved, not only, as was at first suggested, for the R.A.M.C. in Western Europe, but for all the Services. The War Office sees no departmental objection. Indeed, it is stated to be the Government's desire that doctors serving in the Forces over-seas should have an opportunity—as they have had already—of learning what is proposed for the reorganization of civilian health services and of voicing their opinions through the ordinary professional channels. It was laid down even before the White Paper appeared that such discussions did not contravene King's Regulations and that they might be held, subject, of course, to the exigencies of the Service and on the clear understanding that they are to be in off-duty hours, and that the Service channels of communication are not to be used for promoting meetings, or for transmitting opinions of individuals or groups.

Disputed Certificates

A charge was brought against a general practitioner at the February session of the G.M.C. which concerned an interesting point in certification. It was complained by an industrial firm that the doctor had issued false or misleading certificates to certain men in its employment to justify their absence from work, and that in fact he had not seen the men on the dates mentioned in certain of the certificates. No evidence was brought forward concerning the health or conduct or whereabouts of the men during the periods in question, and what was principally relied upon was the suspicious circumstance—as it was described—that three certificates issued to a man in successive weeks bore consecutive serial numbers. It was urged that it was impossible to suppose that in a busy industrial practice no certificates had been issued to other people in the intervening periods. Thus it was inferred that the practitioner had given all three certificates on the same occasion and had antedated two of them. In another instance the certificate bearing a particular date was next or next but one in number to a certificate issued to some-one-else, and in no way challenged, a fortnight later.

The legal representative of the doctor claimed that no charge could be sustained on such evidence, because obviously a doctor might have more than one book of certificates in use at the same time and have used only one book for a particular case. There was other similarly oblique evidence, but the Council dismissed the complaint. Its reasons, of course, were not stated, but it does appear that no charge can be sustained on such evidence as the serial numbers of certificates, and that more direct evidence must be forthcoming if it is contended that a person was not ill or incapacitated when the doctor certified that he was.

International Relations

Readers may recall a meeting of foreign doctors at B.M.A. House last November, a sort of farewell—a little premature in some cases—to members of the profession in Allied countries who would shortly be returning to their native lands to deal with the terrible aftermath of war. Arising out of that is a proposal to have an International Relations Committee in the B.M.A. to help bring together the various medical organizations, particularly in European countries, interested in medico-political and medico-sociological work.

For some years before the war the Association took an active and encouraging part in the work of the Association Internationale des Médecins. For several reasons—no blame attaching to those who organized it, but rather to those who held aloof—the International Association, although it had many good discussions, never became a very effective body. As in all international gatherings, the language difficulty was one stumbling-block, though doctors of different countries probably understand each other's languages better than people in most other callings.

The medical profession in the new Europe which is slowly and painfully emerging will need help in facing more acute problems even than those which confront us in this country, and the B.M.A., with its unexcelled experience of organization in the medical field at home and over-seas, should be able to play a useful part. An International Relations Committee will offer the means of doing so.

A Going Concern

Of all statisticians those who have to do with voluntary hospitals must be the most unfortunate. Here it is the beginning of 1945 and the *Hospitals Year Book* recently to hand can deal only with the figures for 1941. This is not the fault at all of the compilers; it is due to the fact that hospitals are late in sending in their reports, or do not send them in at all, or do not follow the simple requirements for uniform returns. Thus even for 1941 the figures for only 742 out of the 1,112 voluntary hospitals are available.

But those 742 voluntary hospitals in 1941 treated more new patients in their wards than the entire population of Birmingham and more new out-patients than the populations of the counties of London and Middlesex together. They were more than solvent, too, having received something over 19 millions and spent just over 1·7 millions.

What will be the position five years after the inception of a National Health Service? Apparently we shall not exactly know until five years after that, unless in the meantime hospitals act like other business institutions and send in proper returns. The work done by voluntary hospitals ought to be published abroad, not merely surmised, and this cannot be done when details are not available for three or four years, and even then relate only to three-quarters of the hospitals.

The B.M.A. Council

It was surprising, looking up some old B.M.A. records, to find that in the middle of the last century the B.M.A. Council consisted of over 300 members. The Association was endowed at its birth with a Council of 70, and at every one of its annual places of meeting it gathered fresh members of Council, until within twenty years the Council had become a monster. It was not, of course, a real executive. The Association was actually governed during those early years by members living in or near its native city of Worcester, with Sir Charles Hastings at its head.

The Council now consists of 66 members—or 67, when the recently elected woman member presently takes her seat. By a nice adjustment of methods of election, geographical and general, it manages both to secure new blood and to retain aldermanic experience. Apart from the *ex-officio* members and the representatives of special services, there are three portals of entry—election by the Branches, by grouped representatives, and by the representatives as a body.

Suggestions have been made for alteration, but I believe it will be found that the committee which is considering Association machinery will not recommend any change in the general system of Council elections or in the numbers which come to the Council by each of the methods of election.

Membership

The membership of the B.M.A. continues to rise. If the increase of the last twelve months is maintained then during the next twelve the number of members will be well over 50,000.

Government's decision on the sale of practices in the future. He said this was an urgent matter requiring an early reply. If it was not to be allowed, then the question of compensation for loss of capital value would have to be opened at once. If it was decided to make no alteration in the present position, then the sooner this was known the better, so that men about to retire would know they still had a saleable article and would not be penalized by the present uncertainty.

Correspondence

Medical Demobilization

SIR,—"A Medical Officer, R.A.F." certainly had a bad attack of "liver" when he wrote his letter (*Supplement*, March 17, p. 41), and hiding behind his anonymity he could not have been more unjust than he was to many of his colleagues who are also "doing their bit," albeit not in uniform, or to the Local Medical War Committees, who, being faced with a most difficult task, have carried it out in a way that can only be admired.

Who are all these doctors "who are deliberately avoiding service in the Forces"? And how do they coerce the L.M.W.C.? No doubt I come into this category of "those beneath contempt," being one of the youngest doctors remaining in civil practice here, so may I ask for your indulgence most humbly to explain how this happened. And it wasn't so very clever.

Having volunteered for "Service anywhere" in the B.M.A. scheme in 1938 I found that my partner, having joined the Territorials, was called up before war was declared, and I was left to look after his practice as well as my own. Of course I could have rushed to volunteer in the excitement prevailing, but I was advised by older and quite honourable doctors to wait until I was called up. Since then my name has been before the L.M.W.C. several times, and I fully expected to go on the first occasion, but now, after 5½ years, I am still in doubt as to when this may be. During those ½ years I have lived a "comparative eacetime existence," it appears: truly do we live and learn. "Blitzes" and black-out are not worth mentioning, nor is working a mere 13–14 hours a day for months on end without off-duty or leave, but with only a very doubtful summer holiday of one or two weeks if lucky; nd what do C.D. and H.G. mean? As or work itself, to manage two or three practices is easy, it seems, especially when we have the multitude of wartime forms nd certificates to cope with!

I do not pretend that our conditions an be compared with those of doctors on *real* active service, but from what friends have told me I am convinced that the civilian G.P. does very much more work than his Service counterpart, and if a Medical Officer, R.A.F." and I do hange places, it will be he who will have the shock. In the meantime, perhaps he will learn that he is in a profession which is accustomed to using judgment and discretion before making a diagnosis, and is not accustomed to inviting the public to view its linen being washed. I have ften regretted that I was not called up at the beginning of the war, but I am not ashamed of having tried to do my bit at home, neither am I diffident about signing my name.—I am, etc.,

Bristol. W. H. HAYES.

SIR,—Like Wing Cmdr. Durand I have no personal direct interest in this question, being beyond the age and engaged in specialist practice, but I would like to put forward one or two suggestions.

Of the statement by the Central Medical War Committee (March 17, p. 40) I would say, "Soft words butter no parsnips," and it is nonsense to say that medical officers can be released in the same way as the general Forces. On the age factor surely 50% or more would come in the final category for release. It would be fairer to state that a definite plan was in existence and to give some details. It would also be a comfort to all parties if the committee would state definitely that it has a complete list of men in the E.M.S. and elsewhere ready to take the place of men released from the Services. I would also suggest that when active hostilities against Germany are over the grading of many men who are now graded as unfit might be revised in the light of altered circumstances.

As to the age limit of 35 for calling up, I think this should be reconsidered unless all men over this age are automatically released from the Services. A limit of 40 or 45 would be much fairer. Although I am, unfortunately, above even this age limit, I would be prepared to change jobs with a man in the Services for a spell, while he freshens himself up on my busy hospital O.P. department and does his best with my private patients.

Finally may I put in a strong plea that the C.M.W.C. should take a much firmer stand with the Service chiefs in the matter of supply of and demand for medical officers. There is no room for waste of time such as one hears of, and the civil needs are very great. Only during the past week I have had at least half a dozen patients say to me: "I really can't call in my doctor; he is too busy," and this when they are obviously very ill. As to this whip-up of B1 men, every hospital in the country is short-handed at present, so the yield won't be very great until some of the Service men can replace them.—I am, etc.,

"M.O., 1914–18."

SIR,—While the statement by the Central Medical War Committee on medical demobilization (*Supplement*, March 17, p. 407) is encouraging, I was recently informed at a high level that no demobilization will take place in the R.N. until after the Japanese war. One still wonders how the Services will interpret the phrase "military necessity."—I am, etc.,

SURG. LIEUT., R.N.V.R.

Free Medical Treatment for Schoolchildren

SIR,—It is a recognized principle in any democratic country that, when negotiations are proceeding, no change shall be made in existing conditions. Under the new Education Act coming into force on April 1 free medical service is, we read, to be provided by local education committees, the services being for all minor ailments, diseases of the ear, nose, and throat, diseases of the eye, orthopaedic and dental treatment, speech therapy, and the treatment of rheumatism.

If this is not an incentive to "blacklegging" by one branch of the profession without agreement with any other then what is it? One notes that of course *domiciliary* treatment is outside the scheme. One says "of course," for what Government servant, medical or otherwise, would work outside office and school hours! That privilege is left for the general practitioner, who, besides shouldering the bulk of the hard work of the medical services, has to stand by and see his living being insidiously filched from him at the very moment when his representatives are supposed to be negotiating with the Ministry of Health over the terms of the very services that are being put into operation by another Ministry.

Is there any end to what we can put up with?—I am, etc.,

Highgate, N.6. W. LEES TEMPLETON.

⁂ The Secretary of the B.M.A. states: Strong representations on Section 48 (3) were made to the Minister of Education (then the President of the Board of Education) while the Education Bill was before Parliament. Representations on the official level have been made since the Act was passed. We are now awaiting a reply from the Minister to another request to receive a further deputation from the Association on Section 48 (3).

Medical Certification: A Plan of Control

SIR,—Mr. Willink has denied that it was ever the intention of the Government to control medical certification. Your columns have given conclusive evidence to the contrary, arousing distrust and antagonism in the medical profession.

General practitioners know that psychological factors in illness now constitute one of their greatest problems and are liable to become an even greater menace to the financial side of health insurance and to the welfare of the nation as a whole. I venture to suggest that had Mr. Willink stuck to the contention that medical certification must be controlled and asked our help, there would have been more confidence in him and all he stands for than is found at present. In my opinion co-operation between Government and medical profession would be improved by the adoption of such a scheme as the following: it is certainly a description of the help I have wanted for several years.

When the element of doubt as to the fitness for work is present, the G.P. should at once send the patient to the local hospital. Here a complete investigation is done within a week and the report at once sent back to the G.P. Should there then be a difference of opinion between patient and doctor as to fitness for work, the patient should be referred to a Regional Medical Officer, who must be of high academic qualifications, of proved clinical ability, and, vitally important, one in whose judgment the G.P. has every confidence. His decision would be accepted.

This scheme calls for greatly increased hospital and specialist facilities, but we have urged this for many years. The G.P. would be satisfied, since not only the group under discusison but all his patients would have early investigation. The desired control of certification would be obtained under conditions leaving no room for adverse criticism by any party. Lastly, the patient, who incidentally has to have his psychological troubles

MEDICAL DEMOBILIZATION

Recent correspondence in these columns and inquiries received from doctors both at home and on service over-seas seem to show some misunderstanding of the arrangements for the release of medical officers from the Forces and the recruitment of civilian doctors after the end of the European war. On the one hand there is anxiety lest the release plan for doctors should place them in a less favourable position than other members of the Forces. On the other hand there is a demand that medical officers should be specially favoured by the institution of an exchange between Service and civilian doctors before the general reallocation scheme comes into operation. The truth is that the plan of release for medical officers is the plan of release for the Forces as a whole, and it is not proposed that doctors should receive either more or less than just treatment in accordance with the provisions of the Government's White Paper.

A rumour that the plan for release on the basis of age and length of war service is not intended to apply to R.A.M.C. officers serving in the Far East was contradicted by the Secretary of State for War in a recent statement in the House of Commons. What is true is that some members of the Forces, including some medical officers, may have to be retained because of military necessity after they have become entitled to release according to the age–service formula. The Central Medical War Committee has considered the probability that the medical requirements of the Forces for the war against Japan will necessitate the retention of a disproportionate number of medical officers unless special measures are taken to obtain new medical recruits as substitutes for officers due for release. With this probability in mind, the committee has recommended to the Government that recruitment of doctors after the end of the war in Europe should continue up to an age limit in the region of 35—ten years higher than the probable limit of age for recruitment generally.

Writing in the *Supplement* of Feb. 10, an anonymous Squadron Leader suggests that the magnitude of the exchange of doctors between the Services and civilian life will depend on the recruitment efforts of the Central Medical War Committee. While the rate of release must be determined by the Government, it is true that, as has been indicated above, exceptional measures for the recruitment of doctors are likely to be necessary to make the prescribed rate of release practicable so far as medical officers are concerned. Serving officers may rest assured that the Central Medical War Committee will do everything in its power to facilitate, by the provision of new recruits, the release of medical officers in their turn in accordance with the reallocation scheme. At the present time the committee is doing its utmost to recruit every available practitioner, and, in particular, is making a determined effort to increase the yield of recruits from B1 officers in hospitals. After the end of the European war many doctors whose retention in civilian medical work is now deemed necessary will become available for recruitment in exchange for officers released. When that time comes the committee will spare no effort to make possible the return from the Forces of all medical officers entitled to release under the Government's plan.

NEW CHARING CROSS HOSPITAL CENTRE

CO-OPERATION BETWEEN VOLUNTARY AND PUBLIC SERVICES

Charing Cross Hospital is contemplating building a 1,000-bed hospital at Northwick Park in the Harrow area of Middlesex. A site of 20 acres, part of a golf-course estate which has been purchased by the Middlesex County Council, is considered suitable from the point of view of space, aspect, accessibility, and quietness. The headquarters will remain at Charing Cross, ten miles distant, to deal with casualty, out-patient, and emergency cases.

In a memorandum containing proposals which have been approved in broad principle by the Public Health Committee of the Middlesex County Council, Mr. Philip Inman, chairman of the hospital, says that the new buildings would include a medical school with an annual entry of 100 students and a total strength of 400, clinical and preclinical, a students' hostel, a nurses' home to accommodate 400, a training school for probationers, a pathological institute, and an administrative block. There will be a large maternity unit of 100 beds, with associated antenatal and infant welfare centres. It is also considered possible that some special hospitals may wish to amalgamate with the Charing Cross centre.

Beds for the Chronic Sick

One innovation proposed is to set aside 100 beds for the chronic sick, a type of patient hitherto not admitted to the majority of teaching hospitals, but one which the newly qualified doctor quickly discovers. Again, although Charing Cross as a teaching hospital must ensure a suitable variety of teaching material, it is proposed to set aside a specified number of beds for local needs, to be used, if this is the wish of the county authority, to provide a complete hospital service for the inhabitants of a definite area of the county. The hospital would admit all cases from this area without selection if they needed in-patient treatment, except cases of infectious disease and mental cases. It is recognized that the fever hospital, the mental hospital, and the public health services can best be studied under the guidance of the local authority, and much social medicine may be taught under the same auspices. Another field for co-operation between the hospital and the county council may be the provision of clinics for tuberculosis and venereal diseases.

Reciprocal Arrangements with County Authority

If these proposals pass successfully through the stage of detailed consideration, they may well inaugurate a new era in the relationship between a big local authority and a great voluntary hospital. Such linkage as there has been hitherto has had a limited and specialized scope. Here something altogether broader seems to be contemplated.

" It should be possible " (says Mr. Inman) " for reciprocal arrangements to be made for consultations, teaching facilities, demonstrations, and lectures, etc., which would bring far-reaching benefit to all concerned. In this connexion the medical school would welcome an arrangement whereby undergraduate students were seconded to a county hospital for a period of, say, three or six months in the course of their three years' clinical training. During the period they would have opportunity of being instructed by the Council's medical staff upon types of cases not frequently encountered in the wards of voluntary hospitals, and would also learn something of the social and health services developed in the county."

The Middlesex County Council administers eight general hospitals, the largest of which are West Middlesex at Isleworth, with 1,570 beds, North Middlesex at Edmonton, with 1,452, Hillingdon County Hospital at Uxbridge, with 883, Central Middlesex at Willesden, with 874, and Chase Farm Hospital at Enfield, with 925. The Public Health Committee of the council considers that the Charing Cross memorandum " envisages a degree of co-operation between voluntary and public services which has never before been achieved, and it is felt that the present opportunity is therefore to be welcomed." In principle the proposals have been approved, subject to further deliberation and consideration of the various details at a later date.

AMERICAN MEDICINE

Since going to press last week with the short account of medical services in the United States (*Supplement*, March 10, p. 36) our attention has been drawn to an article in a recent issue of the American periodical *Fortune* on the future of that country's medical services. While the article goes over much of the ground covered in the *Supplement* last week, it is interesting for its comment on the attitude of the medical profession generally to medical reform, for its criticisms of the Wagner Bill, and its suggestions for a compromise plan.

The author believes that the medical profession in America can no longer deny the urgency of reforms which will bring a complete medical service within the reach of every member of the community, and that it cannot in its own interest stand aloof from the proposals now being discussed. " The responsibility of the doctors takes the form of a dilemma that they must face: if they do not themselves aggressively foster and encourage considerable reform in medical economics, they are likely to find themselves swept into something that will seem revolutionary by comparison."

He discounts some of the arguments of the American Medical Association opposing the Wagner Bill—i.e., that it would destroy free choice of doctor and upset the doctor–patient relationship and encourage a bureaucratic control of medical practice—and finds other disadvantages in the Bill. The promised services could not be provided everywhere because in many places there are not enough doctors and hospitals. It would not encourage preventive medicine. It would tend to force doctors into the scheme by economic pressure. It provides for too little participation by doctors and insured persons in the administration of the scheme. It has too little regard for the traditions of the profession. It fails to define the place of voluntary activities. The article suggests that, instead of attempting the detailed management of such a complicated national service, the central authority should rather provide grants-in-aid to the individual States and establish national standards.

A Suggested Scheme

The author is in favour of steering a middle course between *laissez faire* and adjusted by the G.P., could be assured that he has had a scrupulously fair deal.

By greatly improving the former R.M.O. system and by avoiding the present dictatorial attitude of Government Departments such a scheme would do much to ensure the good will of the medical profession, and help to persuade them that the health of the nation and not the absolute control of the doctors is the object of the White Paper.—I am, etc.,

Hove. Frank Portas.

An "Ideal" Case

Sir,—What a good thing we haven't a flag! About the only thing people can say is that we haven't hauled it down. We hear of the £420 limit for N.H.I. over the wireless; we read of a free medical service for schools in the daily paper. Surely the time has come to admit that the Government ignore gentlemen and mannerly conduct and pay attention solely to "thuggery." This is an ideal case on which to make a firm stand. The existing school M.O.s are going to have more work, but doubtless no more pay, and certainly no prospect of early relief. They can back up we free men with nothing but advantage to themselves, and say "No" to Mr. Butler or whatever unmannerly Minister is responsible.

Such action must be backed by the B.M.A., for otherwise, after a few Government actions such as this, having no source of private income left, it will be State Medical Service, or starve, or emigrate, if—and a large if—one can get an exit permit.—I am, etc.,

Stamford. A. H. Gregson.

Wartime Appointments to Public Health Posts

Sir,—Permanent appointments are still being made in various health departments of doctors who have either evaded military service or who have been classed as unfit for service. Surely a man who comes under either of these categories is not a suitable person to hold a permanent post. I suggest that drastic action should be taken by the B.M.A. to ensure that all permanent posts should be kept for ex-Service men.—I am, etc.,

Ex-Service M.O.

War Gratuities

Sir,—We wish whole-heartedly to associate ourselves with Wing Cmdr. R. W. Durand's most timely and pertinent letter (*Supplement*, March 3, p. 33). An equally anomalous position is patently obvious when comparison is made between the deferred pay—call it gratuity or pension as you will—of a regular medical officer and a Volunteer Reserve medical officer. The former has preference in rank and seniority which must be accepted. On completion of twenty-one years' service, irrespective of ability, he will have attained the rank of Wing Commander by time promotion alone. On retirement on full pension in this rank he receives £543 per annum. This pension represents a capital sum of at least £11,000 when computed at present rates of interest on trustee stock, or an increase in annual remuneration of over £1,000, allowing for present taxation. The Volunteer Reserve medical officer, having seen his practice largely vanish, has no such pension to look forward to; in many cases he has difficulty in supporting commitments from civil life, and yet is to be fobbed off with approximately £100.

In our opinion the gratuities to be paid to Volunteer Reserve medical officers are nothing more than an added insult to an already long-suffering profession.—We are, etc.,

BRITISH MEDICAL ASSOCIATION

Election of Members of Council

Notice is hereby given that nominations of candidates for election as members of Council, 1945-6, (*a*) by the following Branches; (*b*) by Public Health Service members; and (*c*) by women members, must be forwarded in writing so as to reach me not later than Saturday, May 12, 1945.

Twenty-two Members by Branches in Great Britain and Northern Ireland

	No. of Members of Council to be elected by Group
Group A.—North of England	1
Group B.—East Yorks: Yorkshire ..	1
Group C.—Isle of Man: Lancashire and Cheshire	2
Group D.—Derbyshire: Leicestershire and Rutland: Lincolnshire: Nottinghamshire	1
Group E.—Bedfordshire: Cambridge and Huntingdon: Essex: Hertfordshire: Norfolk: Northamptonshire: Suffolk ..	1
Group F.—Berks. Bucks, and Oxford: Birmingham: Staffordshire ..	1
Group G.—North Wales: Shropshire and Mid-Wales	1
Group H.—South Wales and Monmouthshire	1
Group I.—Metropolitan Counties	4
Group J.—Bath, Bristol, and Somerset: Gloucestershire: Worcestershire and Herefordshire ..	1
Group K.—Dorset and West Hants: South-Western: Wiltshire ..	1
Group L.—Southern: Surrey	1
Group M.—Kent: Sussex	1
Group N.—Aberdeen: Dundee: Northern Counties of Scotland: Perth	1
Group O.—Edinburgh: Fife	1
Group P.—Glasgow and West of Scotland (Glasgow Division)	1
Group Q.—Border Counties: Glasgow and West of Scotland (Five County Divisions): Stirling ..	1
Group R.—Northern Ireland	1

Public Health Service Members

Two members of Council are nominated and elected by members of the Association employed in the Public Health Service as defined in By-law 1 (3). Candidates must be members of the Public Health Service as so defined.

One Woman Member

One woman member of Council is nominated and elected by women members of the Association.

The nominations must be on the prescribed forms, copies of which can be obtained on application to me. A notice will be published by the Council in the *British Medical Journal Supplement* on June 9, 1945, of the candidates nominated. Where contests occur voting papers will be issued on June 9, 1945, containing the names of all duly nominated candidates, from the Head Office, British Medical Association, Tavistock Square, London, W.C.1, to each member in the Group, or to the Public Health Service members, or to women members. A notice will be published by the Council in the *Supplement* of June 30, 1945, giving the results of the elections where there have been contests.

Charles Hill,
Secretary.

CONSULTANT AND SPECIALIST OPINION

An important open meeting of consultants and specialists in the London area, called under the auspices of the Royal Colleges and the British Medical Association, wil be held at B.M.A. House, Tavistock Square, London, W.C.1, Sir Alfred Webb-Johnson presiding, on Monday April 9, at 5 p.m. The object of the meeting is to discuss issues arising from the Government's proposals for a National Health Service and from the Goodenough report.

The discussion will be opened by Lord Moran, P.R.C.P., Mr. Eardley L Holland, P.R.C.O.G., and Dr. Geoffrey Bourne. This meeting is intended for consultants attached to hospitals *north* of the Thames.

A similar meeting will be held at the Royal College of Physicians, Pall Mal East, S.W.1, on Friday, April 6, at 5 p.m. for practitioners attached to hospitals *south* of the Thames. Lord Moran will preside, and the speakers will include Sir Alfred Webb-Johnson, P.R.C.S. Mr. Eardley L. Holland, P.R.C.O.G., and Dr. Maurice Campbell.

WEEKLY POSTGRADUATE DIARY

Fellowship of Medicine, 1, Wimpole Street, W.—*Royal Cancer Hospital*: Daily, Revision course in anaesthetics. *St. Mary Islington Hospital*: Wed. 2 p.m., Final F.R.C.S. demonstration. *Metropolitan Hospital*: Wed., 5 p.m., Final F.R.C.S demonstration. *Hillingdon County Hospital* Sat. and Sun., April 14 and 15, all day, Fina F.R.C.S. week-end course in surgery.

DIARY OF SOCIETIES AND LECTURES

Royal Society of Medicine.—*Tues.*, 5 p.m. Section of Psychiatry. *Fri.*, 2.30 p.m., Section o Ophthalmology. *Sat.* (April 14), 2 p.m., Sectio of Physical Medicine.

Chadwick Trust.—At Royal Sanitary Institute, 9 Buckingham Palace Road, S.W., *Tues.*, 2.30 p.m Mr. A. Trystan Edwards: Sunlight and Sanitatio in Relation to the Planning of Building.

B.M.A.: Diary of Central Meetings

May

2 Wed. **Special Council Meeting, 10 a.m.**
3 Thurs. **Special Representative Meeting, 10 a.m**

B.M.A.: Branch and Division Meetings to be Held

Isle of Wight Division.—(1) At Parkhurs Institution, Wednesday, April 11. 3 p.m., Films t be shown: (*a*) Gas-Air Analgesia in Midwifery (*b*) Closed-circuit Anaesthesia; (*c*) The Productio and Distribution of Medical Gases. (2) At Unit Hall, Newport, Sunday, April 15, 3 p.m., Meeting Agenda: Discussion of the Report of Council o the Association on the Negotiations with th Government on the Proposed National Healt Service, etc.

Westminster and Holborn Division.—At Westminster City Hall, Charing Cross Road, W.C Friday, April 6, 4.30 p.m., Annual meeting followed by meeting of all practitioners in the are of the Division to elect members of the Local Medical War Committee.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head i 10s 6d. for 18 words or less. Extra words 3s. 6 for each six or less. Payment should be forwarde with the notice, authenticated by the name an permanent address of the sender, and should reac the Advertisement Manager not later than first pos Monday morning.

BIRTHS

Burke.—On March 26, 1945, at Hyndland Nursin Home, to Sarah (*née* Hunter), wife of Dr. Irvin W. Burke, M.B., Ch.B., D.P.H., 39, Winto Drive, Glasgow, W.2, a daughter—both well.

Craig.—On Feb. 16, 1945, at Johnstone Hous Belfast, to Molly, wife of Major D. H. Craig R.A.M.C., a son.

DEATH

Reid.—On March 14, 1945, in a nursing hom Alexander Reid, M.B., Ch.B., B.Sc., of Dean House, Deane, Bolton.

State medicine by developing group schemes on a voluntary basis. He believes that if enough doctors and hospitals became available a reorganized medical system could be founded on voluntary co-operative action by employers, employees, municipalities, and other groups. Employed persons, and perhaps their dependants, would be provided for by voluntary group insurance schemes at their places of work, while the medical care of the unemployed and self-employed could be subsidized, if necessary, by the Government. This compromise plan is not worked out in any detail. It is only suggested that the freedom of medical practice must be preserved, that undue competition among doctors must be eliminated, and that the personal relationship between doctor and patient must be safeguarded. The participation of laymen in the management of voluntary schemes is not regarded as an obstacle, for, it is said, doctors have already accepted the lay management of hospitals while maintaining their control of medical matters. Two desiderata are proposed as essential prerequisites for the success of any voluntary compromise scheme. The country must be prosperous, with reasonably full employment, so that the majority of the people are able to pay their own contributions without Government help. Secondly, all the parties concerned—the Government, both central and local, the public, employers, and the medical profession—must exhibit "a degree of social inventiveness and a determination hitherto unknown."

Finally, the writer asks whether the doctors will tolerate a change. He believes the likelihood is increasing, especially since the conviction of the American Medical Association under the Anti-Trust Act in 1943. Local medical societies are sponsoring voluntary medical schemes which the A.M.A. formerly condemned, and it is likely that doctors returning from the Forces will be more in favour of progressive changes. Nevertheless, it is regarded as problematical whether the flow of opinion towards voluntary reform will be fast enough or sufficiently effective "to deflect the solution of the medical-care problem from the channels of federal legislation."

Correspondence

Medical Demobilization

SIR,—A great deal has appeared in your columns about the above, but in every case so far there has been an individual approach, for the writer of the letter has always stated his own case. You may think it appropriate, therefore, that a letter should appear from someone who is not going to be affected, who is not going to lose, and who has a definite job to go back to. The Council of the London and Counties Medical Protection Society has kindly kept my post as secretary open for me during the period of the war when I have been serving with the Forces. It has made up my pay to the salary which I received before the war. I have, therefore, not lost by my service, except that I have lost the increments in remuneration that I would have received had I remained with the Society during the period which I have served.

As I see it, it is desirable that there should be an exchange of practitioners from civilian employment to the Services and vice versa—except in the case of those who intend to make the Services their career—for the following reasons: With very few exceptions the practitioner in the Services loses experience which is valuable to him in civilian life and which, therefore, is valuable to the nation as represented by the general public. This applies throughout the Services, and to specialists as well as to ordinary medical officers. Therefore, in the interests of the nation, medical officers from the Services should be released after a period to maintain experience of civil practice. On the other side, the C.M.P. may state that he has been overworked in many respects, and overwork, we know, leads to staleness. Therefore, from his point of view, it is desirable that he should have a change of employment. There are, of course, many other factors which have already been stated very fully by your various correspondents: the question of being able to live at home or near home; the question of being comparatively free from regulations. But, surely, most important is the question of the maximum number of doctors being in an optimum state of efficiency for the practice which they will be required to follow in the service of the public, as well as in their own interests.—I am, etc.,

RICHARD DURAND,
Wing. Cmdr.

SIR,—After qualifying in 1940 and spending a year as a house-physician, I joined the Royal Air Force in 1941; thus, so far, I have served for some four years, two of which have been spent overseas. It is considered that the following observations are worthy of note.

1. A large number of doctors have volunteered or been conscripted into the armed Forces.

2. A large number of doctors have not volunteered and not been conscripted into the armed Forces. This group can again be divided into: (*a*) those who are too old for service; (*b*) those who are physically unfit for service; (*c*) those who are eligible for service in the armed Forces, but have for one reason or another managed to evade serving in the armed Forces.

3. A large number of Service medical officers are intensely interested in medicine (in the broadest sense of the word), but, apart from the lucky few, have been unable to obtain any real experience in medicine since joining the Services, and this through no fault of their own.

4. While not minimizing the importance of the work that those doctors in group 2 (*c*) have done, they are obtaining a vast amount of clinical experience, they are not separated from their wives or families (in the majority of cases), they are living a comparative peacetime existence, and, last but not least, they are making a considerable amount of money.

5. It is respectfully suggested that after serving for a certain period, say four to five years, a Service medical officer should be given the opportunity to return to civil life and his place be taken by one of those doctors in group 2 (*c*) (and newly qualified men) who are doing such vital work that they cannot be spared to join one of the armed Forces.

6. It is also respectfully suggested that the observation in para. 5 be seriously considered by the competent medical authority and action be taken forthwith.

7. It is impossible to put in writing what the Service medical officers think about those doctors who are deliberately avoiding service in the Forces. The general public should be made conversant with the facts, and public opinion might help the case for the Service medical officers.

8. Medical officers in the E.M.S. are, in the majority of cases, *not* in the Services.—I am, etc.,

A MEDICAL OFFICER, R.A.F.

SIR,—I should be grateful for the opportunity of saying how very strongly nearly all Service medical officers support the views of "Squadron Leader G" (*Supplement*, Feb. 10, p. 21).

My position is very similar to his, except that I am some years older and have served for a rather longer period. I am at present over-seas. I should like to make it clear that the opinions I express are, as I believe, very generally held in the R.A.F. I have not sufficient knowledge of the feelings of doctors in the other two Services to express any views on theirs.

In one respect I fear that "Squadron Leader G" is too optimistic. The Government's promises on release according to age group were, of course, dependent on the "exigencies of the Service," and recent semi-official pronouncements on this point leave one still with the ugly suspicion that doctors will not, in fact, be released with their groups in very many cases. It is undoubtedly this uncertainty as to the future and the possibility of further professionally fruitless years to be spent in occupied Germany or in the Far East which is the basic cause of a great deal of the uneasiness that exists.

I entirely agree that a period of some five years' service with the Forces has done those of us who are not employed in a specialist capacity enormous harm professionally. I read in the *American Journal of Surgery* that many hundreds of doctors serving with the American Forces have already been given long refresher courses in hospitals. One wonders why we have not been given similar opportunities. Most of us would not claim that we have been too busy to spare the time.

Under present conditions, five years' service as a station medical officer in the R.A.F. is almost tantamount to professional suicide in so far as post-war civilian practice is concerned. The failure of the Central Medical War Committee to start any system of exchange as between Service and civilian doctors is causing great bitterness, and, rightly or wrongly, is attributed by Service doctors to one or other of two main factors: (1) The natural reluctance of the Local Medical War Committees to drive their unwilling colleagues into the Services. (2) The equally natural reluctance of the Service members of the Central Medical War Committee to take on civilians, who will have to be trained in that mysterious, and largely imaginary, bogy, "Service procedure." May I, after five years' experience, assure these gentlemen that any doctor of average intelligence can learn all he needs to know of "Service procedure" inside a couple of weeks.

"Squadron Leader G" is quite right. Once Germany has been defeated those of us who have done our share, or even more, in the Services will indeed feel deep resentment if we are required to continue in the Services while younger fit men are allowed to remain in civil practice, with all its attendant advantages

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY APRIL 14 1945

HEARD AT HEADQUARTERS

The 100% Issue and Grant-in-aid Provision

How would grant-in-aid provision facilitate private practice within a 100% cheme? This question has been put to he B.M.A. after the circulation of the Council's recommendations to the Special Representative Meeting. It is not difficult to answer. There are people who, rightly or wrongly, prefer to provide medical care for themselves and their families in heir own way, at their own expense, despite State provision. These people are not only the well-to-do; they are found in all classes of the community. Those in the wealthier classes will be able, if they prefer, to obtain their medical service privately without financial help. Those in the less-well-off groups should be able to give expression no less freely to their desire to obtain their medical service privately. Generally speaking, this will be possible only if, having intimated their intention not to use the service, either in part or in whole, they receive a cash grant—a cash return for their compulsory insurance premium—to aid them to obtain private service. For example, many a working man, when his wife is ill and in need of hospital attention, will desire for her private care in a private room or block. A good case can be made out for enabling that man to obtain a grant-in-aid or refund to help him meet the costs he incurs. The Government recognizes the ight of the individual to use or not to use the service. Having accepted this principle, the Government, it is widely argued, hould make it possible for classes other than the rich to exercise this right by giving them a grant-in-aid for the purpose.

Portrait of Dr. G. C. Anderson

A portrait of the late Dr. G. C. Anderson, in academic robe, has been added to the collection at Tavistock Square. The painter is Mr. Cyril Roberts, who has been for many years prominently connected with the Royal Society of British Artists. Unfortunately, no painting was made of Dr. Anderson during life, with the result that the painter has had to depend upon photographic ecords. This is always an unsatisfactory xpedient, not only because the painter has to work without the mobile features of the living man in front of his easel, but also because he is denied that opportunity for personal knowledge of his subject which is afforded by a series of sittings. If, therefore, the portrait lacks just the final touch of likeness it is in no way the fault of the painter, and those who were not in intimate association with Dr. Anderson may be unaware of the absent "something" which the painter would have added if he had been able to depict his subject during life. But he has produced a fine portrait, conveying the distinction which was natural to Dr. Anderson, and it will hang on the walls of Committee Room "A" at B.M.A. House, where Dr. Anderson was so often at the right hand of the chair.

Local Health Committees

It seems likely that when the new health committees of local authorities are formed and charged with certain duties under the National Health Service Act provision will be made on the lines of the Education Act, 1944, for the inclusion of non-elected members. It is laid down that the Education Committee of a local education authority must include persons of experience in education and acquainted with the educational conditions prevailing in the area, the only proviso being that at least a majority of the members of the committee shall be members of the authority. In somewhat the same way provision would be made for the inclusion on health committees of doctors and other persons of experience in the health services of the area, who would help in the administration of local authority hospitals and any other local government parts of the health plan.

Such an arrangement would mean that the expert and professional voice would be heard at a very important level in the service, and doctors and others would not be required to contest local elections in order to bring their knowledge and experience where it can be most usefully employed in public affairs. Presumably the names of the people to be co-opted on to health committees would be put forward by local medical advisory committees, the establishment of which in county and county borough areas is to be encouraged administratively by the Minister of Health.

Taxation for Health in U.S.

From an American publication which has recently come to us we learn how large a part of the health services of the United States are financed out of general taxation. In the period before the war the annual taxation for health purposes amounted to three-quarters of a billion dollars (the American billion, of course), or about £150,000,000. This sum is said to represent very nearly one-third of the total expenditure on all medical and hospital services in the States. It includes a complete preventive and curative service for the (pre-war) armed Forces; hospital and other medical care for State pensioners and dependent persons; specialized care, largely in institutions, for patients with mental disorder, tuberculosis, and a few other diseases; and, finally, preventive services for the public health.

Under the Beveridge scheme in Britain the estimated annual expenditure on health and rehabilitation services is £170,000,000. On Sir William Beveridge's total security budget almost exactly one-half of the expenditure would be met out of taxation and rates if the scheme were immediately in force; and about three-fifths after it had been running for twenty years.

The Flying Doctor

One of the members of Parliament who went with the recent Parliamentary delegation to Australia, Mr. Spencer Summers, in an address to the Royal Empire Society the other day, described his interest on arriving at Alice Springs, which is in the central southern portion of the Northern Territory and virtually in the middle of the continent, to find the headquarters of the "flying doctor" service. Entering a house, he discovered a wireless operator at that moment conversing with a man 150 miles away somewhere in the Macdonnell Ranges. The owner of the distant voice was suffering from a severe attack of sciatica, and asked if there was any chance of getting a doctor. He was told to come on the air again in three-quarters of an hour "and we will have the doctor for you." When he came on again he described his symptoms and was given advice.

Mr. Summers said that if the case is such that this distant treatment is inadequate an aeroplane and pilot are immediately at the doctor's service, and he sets off to the faraway habitation, and if necessary brings the patient back in the same plane to hospital.

What is the B.M.A.?

One letter received at Headquarters recently stated that the writer had been speaking to many general practitioners, and they were all of opinion that general practitioners should have or form a union, for, he said, "the problems of the general practitioner are numerous, and we do not know to what organization we must appeal to assist us." Well, the majority of the 50,000 members of the British Medical Association are general practitioners. A General Practice Committee is one of the principal and busiest standing committees of the Association. An Insurance Acts Committee under B.M.A. auspices has been doing first-rate work during the past thirty years for general practitioners in insurance practice, and there is a staff at Headquarters daily giving assistance in an immense variety of problems touching general practitioners individually and collectively. It is true that the B.M.A. includes members of all the other branches of medicine, but that only makes its value to its general practitioner members all the greater.

of a normal home life and reasonable chance of professional advancement.—I am, etc.,

"Squadron Leader H."

*** The statement on medical demobilization by the Central Medical War Committee which appears on page 40 will clear up some misunderstandings on this subject, and should reassure "Squadron Leader H" and other correspondents who have written similarly.—Ed., *B.M.J.*

War Gratuities

Sir,—I wish to draw the attention of both the B.M.A. and serving volunteer officers of the R.A.M.C. (of 1939 vintage) to the following points in relation to the treatment it is proposed to mete out to us when our service terminates.

Most of us are now in our sixth year of service and have performed various degrees of onerous duty at home and over-seas, all of which were accepted in the spirit of voluntary duty. The publication of the proposed rate of gratuities has come as rather a shock to me and, no doubt, to all others concerned. Here I am speaking for the class of R.A.M.C. officers who were over 30 years of age on voluntary enlistment in 1939, and are therefore excluded by A.C.I. 1814/43 from obtaining and thence benefiting by the grant of a short-service commission through "age," although this said "age" has never excluded and does not now exclude us from full participation in field units on active operations. In addition some of us are not as physically fit as we once were, yet here we are faced with a future outlook of further service (unstated in amount so far), nearing 40, with families, and neither set employment nor even homes to return to when released.

I claim very strongly that we are being arbitrarily treated and that the least service the B.M.A. can perform for us is at once to petition the War Office in order that all R.A.M.C. officers with over five years' war service become eligible forthwith for the grant of a short-service commission to date from the time of voluntary enlistment. With the attendant financial benefits it would at least ensure that on demobilization we would be given a real chance of rehabilitation in civilian life without enduring a long period of financial and mental stress. I yield to no one in stating that our services have been of no less value than those of the younger volunteer or those of the grudging conscript.

I invite letters from others similarly placed in order that action may be taken by the B.M.A. without further delay to right what appears to myself to be a flagrant passing-over and arbitrary dismissal of services rendered.—I am, etc.,

"Captain, R.A.M.C."

Sir,—Doubtless by the time this reaches you your *Journal* will have received many other communications on the subject of war gratuities, but I would crave space for a few words from one who is serving in Burma with the "Forgotten Army."

In return for our services as medical officers for the best five or six years of our lives a grateful Government is offering officers of my rank (and captains in the case of the R.A.M.C.) the sum of £20 per annum; in other words, the equivalent of 15 days' pay per year. Is this sum seriously the offer of the Government to enable us to build up our practices after an absence of half a decade? How unfairly does the position of the emergency commissioned M.O., who abandons his practice to serve his country, compare with the short-service commission M.O., who, with no pecuniary loss to himself (indeed, usually the contrary), joins the Service probably only a few months earlier than his colleague, and, at the end of his five years, receives £1,000.

Let those of my colleagues who have had the good fortune to remain at home during this holocaust accept this action by the Government as a sign of the treatment the medical profession may receive if they get this State Medical Service for which so many of them seem to be clamouring.—I am, etc.,

F. M. Fox,
Fl. Lieut., R.A.F.V.R.

H.M. Forces Appointments

ROYAL NAVY

Surg. Lieut.-Cmdr. C. P. Collins, D.S.C., to be Surg. Cmdr.

Royal Naval Volunteer Reserve

Acting Surg. Lieut.-Cmdrs. R. L. Kennedy, O.B.E., M. C. Hood, W. L. Kerr, and J. E. M. Ayoub to be Surg. Lieut.-Cmdrs.

ARMY

War Subs. Capt. (now War Subs. Major) W. I. Daggett, R.A.M.C., and War Subs. Major R. Platt, R.A.M.C., to be Consultants, and have been granted the local rank of Brig.

Cols. W. K. Morrison, D.S.O., and E. Percival, D.S.O., M.C., late R.A.M.C., having completed four years in the rank, are retained on the Active List supernumerary.

Lieut.-Cols. J. B. Fotheringham and K. A. M. Tomory, O.B.E., from R.A.M.C., to be Cols.

ROYAL ARMY MEDICAL CORPS

Lieut.-Cols. A. J. Bado and D. Crellin, M.C., having attained the age for retirement, are retained on the Active List supernumerary.

Major (War Subs. Lieut.-Col.) J. N. Atkinson to be Lieut.-Col.

Majors J. G. E. Vachell and J. T. Smyth to be Lieut.-Cols.

War Subs. Major J. L. Gordon, O.B.E., to be Major.

Capt. H. N. Perkins to be Major.

Short Service Commissions.—Lieuts. (War Subs. Capts.) G. J. L. Davies, J. W. Spence, and L. F. Q. Maclaine, from Emergency Commissions, to be Lieuts., and to be Capts.

REGULAR ARMY RESERVE OF OFFICERS

Royal Army Medical Corps

War Subs. Major P. H. Wells has ceased to belong to the Reserve of Officers on account of disability, and has been granted the honorary rank of Lieut.-Col.

Capts. J. N. Heales and C. D. Evans, from Supplementary Reserve of Officers, to be Capts.

TERRITORIAL ARMY

Lieut.-Col. J. McC. Smellie, O.B.E., R.A.M.C., to be a Consultant, and has been granted the local rank of Brig.

Royal Army Medical Corps

War Subs. Capt. O. K. G. Guyer has relinquished his commission on account of disability, and has been granted the honorary rank of Major.

2nd Lieut. I. C. Peebles, from R.A., T.A., to be Lieut.

TERRITORIAL ARMY RESERVE OF OFFICERS

Royal Army Medical Corps

Major F. B. Mackenzie, D.S.O., M.C., T.D., has been granted the honorary rank of Lieut.-Col. on ceasing to be employed.

LAND FORCES: EMERGENCY COMMISSIONS

Royal Army Medical Corps

War Subs. Capts. J. L. Hunter and J. Harkness have relinquished their commissions on account of disability, and have been granted the honorary rank of Major.

War Subs. Capts. C. Moore, T. O'Sullivan, A. S. M. King, G. T. Newton, L. A. Murray, J. H. Gifford, N. Budge, T. G. Tressider, G. Haddick, and J. Essex have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

To be Lieuts.: D. Eglin, H. J. Whiteley, H. N. Green, L. Bernstock, P. O'F. Boyle, W. S. Davis, H. W. Forshaw, M. Footerman, H. K. B. Geiser, A. Goldberger, E. T. Harrison, R. M. Harrison, C. A. Hopkins, J. G. P. Jones, W. P. F. Kearney, M. H. Kerby, E. R. Lecutier, J. A. Leitch, W. E. S. Marshall, A. S. Nethercott, C. R. Oyler, I. Taylor, J. G. Warbrick, J. S. Watson, P. Pinkerton, R. M. Dowdeswell, W. Hood-Dye, J. M. Liston, E. Sorabjee, D. G. Snell, J. R. C. Spicer, P. H. Stone, R. H. Wiseman, B. A. Coghlan, W. A. S. Lamborn, O.B.E., C. H. Phillips, K. C. P. Thomson, E. G. Gibbins, I. W. Beaton, J. McP. Campbell, J. Pugh.

WOMEN'S FORCES

Employed with the R.A.M.C.

War Subs. Capt. (Mrs.) E. G. Gray has resigned her commission.

War Subs. Capts. (Mrs.) L. M. O'Connell and H. M. Schofield have relinquished their commissions.

The following M.O.s have been granted commissions in the rank of Lieut.: Lorna Cooke, Margaret L. Cox, Ruth M. Cyrlas-Williams, Muriel J. W. Dobbin, Jean Edmonds, Margaret A. M. Howard, Margaret E. Lowry, Joyce B. Mole, Joan V. Muller-Rowland, Edith R. Munro, Lois E. N. Turner, Ethel J. Higgitt.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1) Revision course in anaesthetics, all day, April 9 to 21, lectures and demonstrations at various London hospitals. (2) Week-end courses in surgery (suitable Final F.R.C.S.) at Hillingdon County Hospital, all day, Sat. and Sun., April 14 and 15. (3) Final F.R.C.S. demonstration of cases, Sat., April 21, 2.30 p.m., at London Homoeopathic Hospital.

WEEKLY POSTGRADUATE DIARY

Fellowship of Medicine, 1, Wimpole Street, W.—*West End Hospital for Nervous Diseases:* Mon., Tues., and Fri., 2.30 p.m., Course in neurology (suitable M.R.C.P.). *Metropolitan Hospital:* Wed., 5 p.m., Final F.R.C.S. demonstration. *London Homoeopathic Hospital:* Wed., 5.30 p.m., Final F.R.C.S. surgery demonstration. *St. Mary Islington Hospital:* Wed., 2.30 p.m., Final F.R.C.S. course. *St. Stephen's Hospital:* all day, Sat. and Sun., March 24 and 25, week-end course in rheumatism.

DIARY OF SOCIETIES AND LECTURES

Royal Society of Medicine.—*Tues.,* 4.30 p.m., Section of Pathology. *Thurs.,* 5 p.m., Section of Urology. *Fri.,* 4 p.m., Section of Disease in Children; 3 p.m., Section of Epidemiology and State Medicine.

Royal Institute of Public Health and Hygiene, 28, Portland Place, W.—*Wed.,* 3.30 p.m., Dr. Janet Aitken: Rheumatism in Children.

Royal Institution, 21, Albemarle Street, W.—*Tues.,* 5.15 p.m., Sir Henry Dale, P.R.S.: Cholinergic Action in Nerve Ganglia, Motor Nerve Endings, and Electric Organs.

B.M.A.: Branch and Division Meetings to be Held

North of England Branch.—At Royal Victoria Infirmary, Newcastle-upon-Tyne, Thurs., March 22, 7.15 p.m., Anaesthetic demonstration in the out-patient department by Drs. H. H. Markham, W. J. Phillips, E. W. Osselton, P. Ayre, Winifred M. Houston, Joan Miller, and M. Goldston; 8.45 p.m., Address by Dr. J. T. Ingram: Seborrhoeic Problem. Members of H.M. Forces stationed in the area of the Branch are invited.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. *for* 18 *words or less. Extra words* 3s. 6d. *for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.*

MARRIAGES

Boon—Millar.—On March 3, 1945, at St. Ninian's Church, Golders Green, Capt. Frank W. Boon, R.A.M.C., to Judith Jessica Millar.

Thompson—Bäckstedt.—On Feb. 7, 1945, at Brussels, John Thompson (Capt., R.A.M.C.), of Edenfield, Manchester, to Doreen M. Bäckstedt (Sister, Q.A.I.M.N.S./R.), of Flamstead End, Herts

Among the speaking engagements in the next few weeks of the Secretary of the B.M.A. are the Rauceby R.A.F. Medical Society on March 15, Birmingham Rotary Club on March 19, Manchester Luncheon Club and annual meeting of St. Mary's Hospitals, Manchester, on March 28, Rugby School on April 4, public meeting and Division meeting at Exeter on April 19, and a public meeting at Coventry on April 25.

THE CHARTERED SOCIETY OF PHYSIOTHERAPY

On May 1, 1944, the Chartered Society of Physiotherapy notified the Board of Registration of Medical Auxiliaries by letter that it had "resolved that the Chartered Society resign its membership of the Board of Registration of Medical Auxiliaries," to take effect as from Dec. 31, 1944. No reason was given.

It is not known exactly when the Chartered Society of Physiotherapy took the first steps which ended in its resignation from the Board, but the beginning seems to have been the decision of the Board to send a deputation to the Ministry of Health to discuss the position of medical auxiliaries in the proposed National Health Service. The Board asked each constituent body to prepare a statement for inclusion in a comprehensive memorandum to be submitted to the Ministry, and the Chartered Society appointed its vice-chairman as a member of the committee charged to prepare the memorandum. The Chartered Society did not, however, submit its views and declined to send a representative to the Conference held at the Ministry on May 11, 1944.

On May 31 the Board decided to ask the Society to receive a deputation from the Board to discuss the matter. A conference was finally held on July 26. The Chartered Society's representatives had, however, been instructed by their Council to hear the views of the Board's representatives but not to enter into commitments. After a report of the meeting had been submitted to the Council of the Society, it again notified the Board of its wish no longer to remain as a recognized qualifying body. The Board therefore submitted the following memorandum to the Council of the British Medical Association:

> The Board of Registration of Medical Auxiliaries desires to remind the Council that the formation of the Board was determined by the policy of the Association through its Council and the Representative Body, and considers that the question emphasized in this document is one of grave import. The Chartered Society of Physiotherapy have resigned from the Board of Registration of Medical Auxiliaries. This resignation will take effect from Jan. 1, 1945. The Council of the Board considers that this action of the Chartered Society of Physiotherapy, taken without any poll of their members, and without previous notice to the Board, jeopardizes the safeguards which the British Medical Association and the co-operating bodies had provided for the public by the institution of the Board. So long as the Chartered Society of Physiotherapy remained a member of the Board the medical profession and the public had the following guarantees in reference to physiotherapists on the Register: (*a*) that the governing body of the Register was a body independent of the teaching schools and examining bodies (cf. the General Medical Council); (*b*) that the governing body was so constituted that it always had a majority of qualified medical practitioners on its Council (a safeguard against abuses); (*c*) that it had the right of inspection of schools and of examinations; (*d*) that those registered had been through an adequate course of training; (*e*) that they had undertaken to carry out treatments only on the recommendation of a registered medical practitioner.
>
> With the defection of the Chartered Society of Physiotherapy the following consequences arise: (1) The Chartered Society of Physiotherapy become their own training, examining, and registering body. (2) Those on their register will be under a council which has a large majority of technicians as distinct from medical men. (3) At any time the members and/or Council can annul the condition, now existing among their rules, that physiotherapists must treat patients only under a doctor's direction and control. The effect of this action would be that physiotherapists would be in a position similar to osteopaths. (4) Future members of the Society will not therefore be able to register with the Board, as, under the constitution of the Register, every person admitted must be a member of a recognized qualifying body. (5) Those remaining on the Register will have no representation on the Council of the Board.
>
> Since the British Medical Association was largely responsible for the creation of the Auxiliaries Register, the Board desires to inform the Council of the Association of the above facts and would appreciate definite guidance. The Board is of opinion: (i) That immediate action is required to safeguard those physiotherapists who wish to remain loyal to the principles of a separate registering body under a medical aegis. (ii) That it might be desirable to ask the Society of Apothecaries of London to revive the biophysical assistants examinations and diploma under a name more in keeping with the recent developments in rehabilitation. With this end in view it is suggested that a conference of representatives of the Board with the British Medical Association be called to approach the Society of Apothecaries. (iii) That the Council of the B.M.A. should consider whether the action of the Chartered Society of Physiotherapy renders it desirable to promote legislation for the State Registration of all those employed in medical auxiliary work.

This was considered on Nov. 8, 1944, when the Council passed the following resolution: That the Council regrets that the Chartered Society of Physiotherapy should have thought it necessary to withdraw from the Board of Registration of Medical Auxiliaries and expresses the hope that on reconsideration the Chartered Society will reverse its decision—bearing in mind the public and professional issues involved. A copy of this resolution was forwarded by the B.M.A. to the Chartered Society and the Ministry of Health. The Chief Medical Officer of the Ministry then invited the Chartered Society, the Board, and the British Medical Association to a conference, at which the Society reaffirmed its wish to separate and have its own register "on the lines of the Register of Nurses."

The Board of Registration of Medical Auxiliaries circularized all registered physiotherapists on Feb. 13, setting forth the present position and asking them not to withdraw their names from the Register. Out of 8,500 approximately 2,000 members withdrew from the Register, but more than 200 have subsequently cancelled their notice of withdrawal.

HOMOEOPATHIC MEDICINE

Petition for Formation of a Group

The following petition for the formation of a Group of Homoeopathy within the British Medical Association has been addressed to the Council.

We, the undersigned members of the British Medical Association engaged in the study and practice of homoeopathy, beg hereby to make petition that a Group of Homoeopathy be established within the British Medical Association.

The number of members who practise this specialty in any one Division of the Association is too small adequately to present their problems. We are of opinion that the formation of a group of those limited in their practice to homoeopathic medicine would be an advantage not only to the specialty but to the Association.

Such a group would deal with the conditions affecting the work of practitioners in this specialty.

In our view membership of the group should be confined to those members of the Association who are engaged predominantly in the practice of homoeopathic medicine and who sign a declaration to that effect.

A circular to local education authorities on their duties under Section 48 (3) of the Education Act, 1944, which came into force on April 1, while admitting that for the duration of the war, and probably for longer, development of the school medical service will be restricted by the shortage of doctors, dentists, and nurses, suggests measures that can be adopted in the meantime. Existing schemes should be improved so that all the normal facilities of the school medical service—such as treatment of minor ailments, diseases of the ear, nose, and throat, and defective hearing, diseases of the eye and defective vision, and also orthopaedic and dental treatment, child guidance, speech therapy, and the treatment of rheumatism—are readily available for all pupils who need them, at no cost to the parent. The school clinics which have not hitherto provided these services should now do so, arrangements being made with consultants—e.g. aurists, ophthalmic surgeons, dermatologists, and specialists in children's diseases. Hospital treatment should be provided where necessary. Local education authorities may also extend their arrangements with hospitals for the treatment of other conditions (except tuberculosis and infectious diseases, for which they already have statutory functions). Every effort should be made to improve the medical service for children attending schools in rural areas, perhaps by arrangements with local general practitioners for the treatment of pupils referred to them by their medical officers or nurses. Such treatment might be given in the schools or other suitable places or in the doctor's own surgery. Payment for the treatment should be agreed between the authority and the doctor on a suitable basis. The circular ends with the reminder that these suggestions are of an interim nature and without prejudice to any decision which may be reached on a national health service

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY MARCH 24 1945

HEARD AT HEADQUARTERS

The Negotiating Committee

Two months of really hard work has been put in by the Negotiating Committee. Between January 12 and March 13 four meetings of the full committee have been held, as well as five meetings of a special subcommittee which was set up to discuss the details of the administrative structure of the proposed National Health Service. The energy of the negotiators on the side of the profession has been matched on the side of the Ministry. At eight of the total of nine meetings representatives of the Ministry of Health and the Department of Health for Scotland have been present, and on six occasions the Minister himself and on five the Secretary of State for Scotland have attended.

The first part of the Negotiating Committee's work has been concerned with the administrative side of the service, and the representations made have been based upon the views of the Representative Body and of other constituent members of the committee.

A special meeting of the Council of the B.M.A. was called for last Wednesday to consider a report from the committee bearing especially upon certain suggestions for an alternative structure for both central and local administration.

The Remuneration Committee

The Spens Committee on Remuneration is getting down to its task. It has already held its first meeting and decided on its working plan, and the expectation is that it will report in the early autumn, about six months from now.

The B.M.A. committee which is preparing evidence for the Spens Committee on general practitioners' remuneration is setting about its task in a workmanlike way. Its first business, though not the whole of its business, is statistical inquiry, and here it is being assisted by an expert statistician. It is seeking, first of all, for a solid foundation of fact concerning the remuneration general practitioners received in what can be called normal times. For this purpose as a first step it is obtaining information (which, of course, is being treated in the strictest confidence) of the actual incomes of doctors of various ages and in all types and conditions of practice before the war. It has sent inquiries to 5,000 general practitioners, including a number now in the Services. These men and women have not been specially selected, they have been chosen at random, the size of the sample in relation to the whole number concerned being large enough to prevent such random selection giving a freak result.

To the possible criticism that the sample might not give the true facts of the case because the average would be adversely affected by the inclusion of practices in depressed areas where fees were abnormally low, or in sparsely populated districts where expenses were unduly high, the reply is that it is not the dead average which is sought, but a range including the higher as well as the lower income groups, so that the estimate of what a doctor *ought* to earn can be based on what he *could* earn under different and varied conditions. The care taken over the whole of this part of the inquiry makes it unlikely that there will be any serious challenge on statistical grounds.

At the same time, statistics cannot tell the whole story. It is not enough to deal with the normal financial expectations of practices in the past. A range of incomes has to be recommended which will maintain the social and economic status of general medical practice in relation to the emoluments of other professions, the place of the doctor in the community, and the circumstances, so far as they can be forecast, after the war.

A Broad Case

On a "bread and butter" issue of the kind with which the Spens Committee is dealing it is natural that some doctors should wish to put forward their own views and experiences which they may consider exceptional and should be anxious lest a particular angle be overlooked. But the Spens Committee, if its task is not to be unduly prolonged and complicated, must rely mainly on evidence presented to it by representative bodies. Therefore those who have useful suggestions to make will be likely to further them best by sending them direct to the B.M.A., where they will be considered by the committee which is planning the evidence, and in so far as they have value and have not already been covered by what the committee has done or proposes to do they will be given due weight in its representations.

It is worth while to add that the members of the Evidence Committee are all men engaged in general practice and representative of different types of areas, and it is unlikely that any important factor has been omitted from their considerations. The committee is anxious—and the same, of course, may be said of the Spens Committee itself—not to lose sight of anything that is relevant, but it is anxious also not to overload its consideration with extraneous matters.

The Askwith Agreement

Although the Spens report will deal with general practice, it is bound to have its repercussions in other branches of the profession, notably in the public health service. Those who speak for public health medical officers are considering the termination of the Askwith agreement, which concerns the salaries of whole-time men and women. The agreement was made in 1929 as the result of a conference, under the chairmanship of Lord Askwith, between the associations of local authorities and the B.M.A. It was an agreement for five years, and thereafter renewable from year to year. To bring it to an end one year's notice has to be given by any of the subscribing bodies.

Medical Auxiliaries

It is now twelve years since the B.M.A. co-operated in the construction of the *National Register of Auxiliary Medical Services,* but perhaps not everybody realizes what the word "auxiliary" covers. There has lately been issued from the offices of the Board of Registration of Medical Auxiliaries at B.M.A. House a pamphlet saying exactly who these auxiliaries are, the numbers in each specialty, the methods of training and qualification, and how their services can be best utilized in a National Health Service.

Each group has its recognized qualifying body. The radiographers who belong to a society number 1,850. The chiropodists belong to five recognized bodies, presently, it is hoped, to be merged into one, and number about 3,000. The speech therapists, who have their college, and the orthoptists, who have their board, are few in number, about 200 of each. The dietitians, who have an association, number 345, and it is said that the demand for their services is at present greater than the supply. Another group is that for dispensing opticians, whose numbers are not stated, but who have their qualifying association. Absentees from the list are, unfortunately, the physiotherapists—the Chartered Society of Physiotherapy, which was one of the founder members of the Board, having withdrawn its membership.

It is useful to have this information in such handy form. The Board of Registration is not a statutory body, but it is the only one to represent these services collectively, and it fulfils a function which should be helpful to the Ministry of Health.

The Education Act

The shortage of medical man-power is making it extraordinarily difficult to provide for the extension of medical services under the new Education Act. The proposals in sect. 48 (3) of the Act are intended to secure that comprehensive facilities for free medical treatment, other than domiciliary treatment, are available for all pupils in attendance at school. These proposals mean an increase in the medical staffs of local education authorities at a time when the medical resources of the country are strained to the utmost. Nor is it a shortage of doctors only—though that is the principal difficulty—but a shortage of nursing staff, domestic staff, and of hospital accommodation in view of the continued occupation of beds by the E.M.S.

Representations have been made to Mr. Butler on the subject. It has been objected in official quarters that it would place the Minister in an embarrassing position if he had to inform the House of Commons that because of the medical man-power situation he could not advise local authorities to carry out their duties, and that an amending Act would be necessary to delay the coming into operation of the section. But the Ministerial difficulty is surely no matter for shame. It is due to the prolongation of the war.

Correspondence

Medical Demobilization

SIR,—I have followed with interest the correspondence which has appeared in your columns during the last few months about medical demobilization. I have also been amused by the tones of shrill and righteous indignation in which some letters have been couched. Do certain serving doctors think that they are alone in suffering hardship in this war? They have only to look among the ranks of serving lawyers, bankers, etc., to find cases which appear far harder, not to mention the immense number of small shopkeepers and business men who have lost all.

Why should the doctors' burden be regarded as specially grievous? We at least are given commissions on joining, a job we know about, and a higher rate of pay than the average, and, with a modicum of good sense, can find Service life devoid of neither interest nor pleasantness. Furthermore, I deplore the attitude of "Medical Officer, R.A.F." (March 17, p. 41) and others in regarding civilian doctors of military age as evading service. The great majority work heart-breaking hours, take no holidays, and would give a great deal to be able to join one of the Services. These insinuations are unjustified as well as undignified, and the sooner they cease to appear the better. I think that "Medical Officer, R.A.F." and his friends are a very small minority, and, like most minorities with an imaginary grievance, rather vociferous. I am in my sixth year of service and have twice been over-seas—Europe and the Far East—so have had the opportunity to discuss medical call-up and demobilization with many other doctors, and I have seldom heard the opinions of "Medical Officer, R.A.F." put forward, and often have I heard a partner or friend left in "Civvy Street" to carry on spoken of with compunction amounting to anxiety on account of the tremendous burden of work he has been left to cope with. I would like to suggest that it would be in the interests of the public as well as to our own advantage if some really good refresher courses on full pay (for our wives and children must live) were arranged for medical officers who wish to avail themselves of them before demobilization. Failing this, most of us will not be able to afford a postgraduate course or house job.—I am, etc.,

PAUL HARRIS,
Capt., R.A.M.C.

Medical Demobilization and the E.M.S.

SIR,—There has been an abundance of correspondence of late from members of the armed Forces, some of whom write with considerable rancour, which is directed in a large part against the members of the E.M.S. The former appear to imagine that the E.M.S. is staffed by large numbers of fit young men who are "hiding" therein in an effort to evade military service, who earn large salaries, and collect numerous postgraduate qualifications. This is nothing more or less than a travesty of the facts, and a malicious injustice to the intelligence of the Central Medical War Committee and the Department of Health.

Have the writers stopped to consider the following facts? The E.M.S. is staffed (or understaffed) largely by men who are unfit for military service or have been rejected from the Forces on this account, by women whenever possible, and by foreign refugees. To those who suggest an exchange between the E.M.S. and the Forces I would reply that first they should consider seriously whether such is at all practicable from the point of view of numbers. The few fit men in the E.M.S. would permit of the release of but a small fraction of those wishing to leave the Services before hostilities cease.

One would imagine from the correspondence that it was extremely easy to walk out of the E.M.S. and into the Services at will. This is anything but the case, and it is, in fact, no easier to leave the E.M.S. when one becomes tired of it than it is to leave the Forces. Can a man walk out of a munition works, to which he has been directed, into the Army, and another come out of the Army to take his place because the latter feels like a change?

With regard to the pay, this is, generally speaking, lower in all cases in the E.M.S. than in the Services, and there are no family allowances, etc. As regards postgraduate qualifications, I am under the impression from reading the results of graduations that the greater proportion are obtained by members of the Forces who have the time to spare for study. Admittedly the E.M.S. permits of what is called "home life" to a limited degree, but this is also true of a large number of members of the Forces who are stationed in this country and who have never been posted abroad. From the point of view of numbers available for the purposes of an exchange, it would seem that there are more of the latter available for this than could be obtained from the E.M.S. It would seem also that some form of liaison between the three Services where all are stationed in one area would free a number of men for fuller employment elsewhere. Medical man-power is not being wasted in the E.M.S. Is this true of the Services?—I am, etc.,

"EMBEE."

General Practitioners in Country Areas

SIR,—There is reason to believe that the Central Medical War Committee does not appreciate the position of the general practitioner service in the small country towns and rural areas throughout the Provinces. Nearly six years of war have taken a heavy toll of the civilian doctors, partly through natural causes, but largely the result of overwork. There have been no recruits whatever. A very large proportion of those left to carry on are just thoroughly tired men. Many are suffering from physical infirmities which call for retirement. They carry on because they must. There is simply no one to replace them. They can neither sell their practices nor give them away. A national patriotism compels many to stick it till Germany is beaten.

And what will the C.M.W.C. do then? Either they are aware that the shortage of general practitioners is acute, not to say alarming, or they are not. If they have this knowledge it is to be presumed that they have made comprehensive plans to meet the emergency directly the European war is over. If they are not alive to the gravity of the situation they would be wise to inform themselves by inviting representative doctors—with no axe to grind—to appear before them as witnesses.—I am, etc.,

Bath. C. EDE.

This Latest Intrusion

SIR,—I have waited for some protest to be made against the provision in the Education Act for free medical treatment, other than domiciliary, for all pupils in attendance at schools. Not even the voice of the B.M.A. has been raised in protest against this further intrusion upon general practice, although, I understand, the Association was not consulted before the section was introduced. One is tempted to ask who is to be responsible for non-domiciliary treatment of these children between Friday afternoons and Monday mornings and on Bank Holidays and other occasions when school medical officers retire to the privacy of their homes.

Antenatal care is now largely taken out of our hands as general practitioners; the care of the child up to school age is in the hands of infant welfare centres and health visitors, whose advice is often counter to that of the doctor actually attending the child at the time. It is almost impossible, in this country at all events, to get a school child's tonsils and adenoids removed after the age of 5 if the school medical officer disagrees, although we, who see the child through its attacks of tonsillitis, cervical adenitis, and otitis, feel it is essential. Diphtheria immunization in certain instances in this county has been handed over to health visitors, and with the new Education Act one is left wondering if it is really necessary to introduce State medicine, which appears to be already a fact.—I am, etc.,

R. A. MCCABE.

Higham Ferrers, Northants.

A Doctor Decides

SIR,—My colleagues may be interested in my decisions. My medical career includes 20 years spent in general practice in Halifax. The interests of the public and the interests of my colleagues in the Public Health Service (this is often overlooked) depend upon a strong independent profession. Independence in the long run is only possible if this includes financial independence, and the latter disappears the moment one's total remuneration comes from one source. This explains the paradox that while N.H.I. has, on the whole, been a good thing for public and profession, its 100% extension would not be a good thing, as it would mean a profession not independent but wage-slave in type.

I am willing to consider entering any State medical scheme provided I can earn at least, say, £350 from the practice of my profession outside any such scheme. Should a scheme put forward by any Government not offer financial independence I shall endeavour to carry on outside the scheme.

If I am unable to earn a living under these conditions I shall have to terminate a life-long enthusiasm. I may have to become a wage-earner in some other calling, but I won't become a medical one, and I shall have the satisfaction of having done my small part to save our grand profession from the stranglehold of the python of bureaucracy.—I am, etc.,

WILLIAM CRAIG.

The Terms

SIR,—Sir Ernest Graham-Little's letter (*Supplement*, March 10, p. 38) is a timely reminder to those supporters of the State Medical Service who appear to think that the doctors will be able to fix their own terms of service and remuneration. Let

"MAJOR OPERATIONS, 160"

BY

C. E. S. FLEMMING, M.R.C.S.

At a meeting of subscribers to a small hospital a member, reading the annual report, remarked, "Major operations, 160; how blood-thirsty these surgeons are getting!" A medical subscriber countered: "No, it is the committee that are blood-thirsty; they believe that the more major operations that are performed the greater will be the reputation of the hospital and the more the subscriptions."

This idea—that major operations are an index of the efficiency of a hospital—is probably at the back of the minds of the committees of many hospitals, especially the smaller ones, which adopt this custom. It does not apparently matter what the definition of a "major operation" is, nor how many there are; the point is, that this is the standard adopted. In one large hospital a detailed account is given of all the surgery, and there is no direct evidence in the report that there even exists a medical department. The other day I asked the matron of a small hospital how they were getting on. She replied: "Oh, splendidly; we do a lot of big surgery here." Of course the prime interest of the committees is the welfare of the patients, but this outlook on surgery is natural because the results of surgery are generally more immediately manifest, more dramatic, than are those of medical treatment. The effect of this is an appreciation of the work on the surgical at the expense of that on the medical side.

No one with any knowledge of hospital work will for a moment wish to detract from this tribute to surgeons, whose skill, untiring devotion, and success can never be too highly esteemed, but, unfortunately, there follows an unintended but consequent lack of due regard for the work in the medical wards, aggravated by a want of better, fuller knowledge of what is done there. The public does not realize that the nominal separation of medicine and surgery is only artificial, that the two are interdependent, that the great surgeon is physician too. It has been said that surgery is the handmaid of medicine and gets all the smiles, but if that is true it implies that medicine is mistress and largely controls as well as requires the work of the surgeon. The physician tries to obviate the need for operation, and by early diagnosis and treatment often succeeds; where he does he should have credit for accomplishing something better, though, to the layman, less obvious, than operation. Strategy may be more important than battle.

It may be said that failure in medicine is negative: just failure and nothing more. The demand on the surgeon is greater; failure is positive; a badly set fractured ankle becomes a lifelong limping advertisement of failure. Better appreciation of what medicine can do today should bring a corresponding verdict on its failure. In that delightful book *Confessio Medici*, Stephen Paget writes that the work done in twenty years by a surgeon in charge of forty hospital beds will have saved 72,000 years of other people's lives. This somewhat fantastic deduction might with equal if not better reason be applied to-day to a physician.

There is much in medical treatment that is as striking as the best that is done in surgery, and would be as manifest to the public if it could be shown in a film of the life of the patient, which, without medical science, would have ended in misery or death instead of enjoyable years. What more striking than photographs of a myxoedematous patient taken before and after treatment by thyroid; what more dramatic than the recovery under treatment by insulin from the distressing weakness and threatened death of a diabetic patient; or the saving by liver extract from the otherwise inevitable end of pernicious anaemia? Countless years of dreadful disease have been prevented by salvarsan, and what more remarkable to-day than the results of treatment, in all departments, by the various sulphonamides and by penicillin? In another category is the prevention of years of invalidism in patients with heart disease if they are treated as Mackenzie taught.

The result of this marked appreciation of surgery is a desire in district hospitals for the development of their surgical work, and, consequently, a demand for the help of members of the surgical staff of the central hospital—help that is as valuable as it is welcome. But this means that the beds in district hospitals are, in an increasing proportion, occupied by surgical cases, and are thus diverted from their original purpose of providing accommodation where local general practitioners, with the help the hospital gives, could look after their own patients as efficiently as could the central hospital. The patients would receive that attention, observation, rest, dieting, as well as medical treatment, which are essential for success. It is only with such help that a doctor can in many cases efficiently carry out treatment. Here, too, he would be able more easily to overcome the "barbed wire entanglement" of the bottle of medicine. The help and advice of other specialists as well as surgeons from the central hospital would increase the value of the work done, and in the annual reports all this might with advantage be acknowledged with due emphasis. It has often been stated that there is an opportunity in district hospitals to specialize in surgery; why not in other branches of practice? This would be greatly to the benefit of the residents in the neighbourhood.

This "requisitioning" of surgical experts by small hospitals, with all the visiting that this means, will surely be one of the urgent matters to be considered in discussions on the future of hospital services. It must impose a heavy strain on the surgical man-power of a central hospital area. The surgeons themselves will be the last to complain, but their work is hard—frequent visits, long journeys, urgent calls, often great fatigue, at times even unto death—all given freely. This system of performing operations in a district or cottage hospital which could, without detriment to the patient, be equally well done at the central hospital involves a waste of valuable and much-wanted skill and energy.

Other questions arise, such as the number of beds that are in fact provided and maintained by the districts for the central hospital, the cost of which should be credited to the districts concerned, and these should be taken into account by those undertaking the proposed reorganization of our hospital system.

Correspondence

Time for a Change

Sir,—Passing through Rome I attended the R.A.M.C. surgical congress—the most electric one to which I have ever been. In contrast with the mental stagnation that seemed to me to have settled on us in London it was alive with thought and youthful experience. But, alive as these young men were, there is another side to the picture. They have children, they have wives, some have as yet no children. They yearn for home and see there in mental picture their contemporaries. These young men abroad allow everything for what those at home have suffered by bomb and dreariness, but the latter have seen their wives, they have begotten children, they have played with their babes as they grew up, be it only at times and in lodgings; while these Service men here have had but a camp kit in a whitewashed room or in a tent in a boiling sun or on a cold hillside. They feel that it is time for a change over, at any rate for a while. Surely, Sir, this should be possible. If it cannot be arranged locally it should be generally. If one hospital at home has no men away on active service who are to be trusted to care for civilian sick, there must be men from elsewhere who could be drafted to it and given a period of duty at home, while those thus released could go away and see if they could rise to the state of mental morale that I saw in these young men in Rome.

At the end of the congress there was a meeting which discussed this matter. I did not feel I was entitled to attend—I was not one of them—but I know from talking to many from hospitals all over the country that they feel this strongly. Major-General Mitchiner made a statesmanlike appeal that there must be no split or rivalry among the young men—and women—of our profession, between those of the fighting Services and those of the E.M.S., between those who have gone away and those who have been kept at home. In loyalty to this appeal the men here will not express their views publicly or take concerted action to gain what they think their due. But it may be well for a senior to express the view that Mitchiner's aim may best be gained by some such change between the two whereby each may have belonged to both and know the difficulties of each.—I am etc.,

Palermo. T. B. Layton.

A Faculty of Ophthalmologists

Sir,—I write to support the plea fo unity among ophthalmologists in Dr C. R. Duncan Leeds's letter (*Journa* March 3, p. 311). I agree with him whe he points out the undemocratic nature o the council of the new Faculty. It i desirable and even necessary that ophthalmologists should have the benefit of guidance by senior men, but one fails to se why a 15 to 6 majority should be necessary on the council, and must produc fears that wishes of the juniors will no be adequately considered. The constitution of the Faculty provides that an member or associate has the right t bring up for discussion subjects withi the province of the Faculty at annua general meetings, but even if passed b a majority there is no guarantee th they will not be vetoed by the counci

The B.M.A. Ophthalmic Group i democratically elected, but of the 1 us see what we have been offered so far in exchange for our freedom. Salary £450 to start with, rising to £700 about the age of 40, and a maximum of £1,000. These are the figures budgeted for in the White Paper and can be easily arrived at by a few simple calculations. Compensation for practices, purely nominal, a little addition to the pension at 65—such was what our Secretary told us was the Government's offer that went back in the discard.

When one considers the absence of guts displayed by the doctors so far in facing up to the Minister, I suppose these terms are as much as one could expect. Only one action will bring the Government to its senses and that is preparation for organized resistance. A teacher recently told me it does not matter much what original terms are given the doctors; once roped into a State Medical Service the Government can always apply cuts on economy or other grounds. If the doctors object the propaganda machine will be put into action as it is at present to discredit them.—I am, etc.,

London, S.E.1. W. B. PEMBERTON.

H.M. Forces Appointments

ROYAL ARMY MEDICAL CORPS

The notification regarding Lieut.-Col. M. B. King, M.C., in a *Supplement* to the *London Gazette* dated March 16 is cancelled.

Major R. V. Franklin to be Lieut.-Col.

Short Service Commission.—Lieut. (War Subs. Capt.) T. B. Harrison, from R.A.M.C. (Emergency Commission) has been granted a short service commission in the rank of Lieut., and to be Capt.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major T. J. Hallinan, O.B.E., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

SUPPLEMENTARY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

War Subs. Capt. D. N. Parry has retired on account of disability, and has been granted the honorary rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Col. (Temp. Major-Gen.) P. H. Mitchiner, C.B., C.B.E., T.D., K.H.S., to be Hon. Col., R.A.M.C. Units, the London Division.

War Subs. Major H. K. Ashworth to be a Consultant, and has been granted the local rank of Brig.

War Subs. Capts. G. U. Gregson and J. R. O'Neill have relinquished their commissions on account of disability, and have been granted the honorary rank of Major.

War Subs. Capt. P. F. Evans has relinquished his commission on account of disability, and has been granted the honorary rank of Capt.

The following supernumerary for service with Edinburgh University Senior Training Corps (Medical Unit) have resigned their commissions: War Subs. Major I. Aird and Lieuts. J. B. Borthwick, S. A. Smith, and A. E. Ritchie.

Lieut. J. S. Young, M.C., supernumerary for service with Aberdeen University Senior Training Corps (Medical Unit), has resigned his commission.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

Lieut. (Miss) M. Sidgwick has relinquished her commission.

The following M.O.s have been granted commissions in the rank of Lieut.: Margaret R. Connolly, Helen D. Laws, Pauline M. Philpot, Constance A. C. Ross, Adeline H. Thompson, Patricia E. Q. Walsh, and Elsie J. Whittaker.

INDIAN MEDICAL SERVICE

Major-Gens. R. H. Candy, C.I.E., and J. S. S. Martin have retired.

Lieut.-Cols. A. H. Shaikh, C.I.E., and J. B. Vaidya have retired.

Major E. G. Montgomery to be Lieut.-Col.

Capt. S. W. Allinson to be Major.

EMERGENCY COMMISSIONS

Major A. D. Dyson has relinquished his commission on account of ill-health, and has been granted the honorary rank of Major.

Capts. S. F. Seelig, W. M. Niblock, T. P. Mulcahy, P. A. Hubbard, and F. E. McLaughlin to be Majors.

Capt. G. Henderson has resigned his commission and has been granted the honorary rank of Capt.

BRITISH MEDICAL ASSOCIATION

Branch and Division Meetings to be Held

BRISTOL DIVISION.—At Physics Lecture Theatre, Royal Fort, Bristol, Thursday, April 19, 8.30 p.m. Dr. F. C. Collingwood: Empire Air Routes through Africa to India.

EAST SOMERSET DIVISION.—At Small Hall, Wells, Sunday, April 15, 2.30 p.m., Annual general meeting. 3 p.m., Meeting of all medical men in the area of the Division for Discussion of Report of Council on Negotiating Committee.

EXETER DIVISION.—Dr. Charles Hill will give an address on "The Proposed National Health Service" before a special meeting of the Division at the Museum, Queen Street, Exeter, on Thursday, April 19, at 3.15 p.m., and again at 6.30 p.m. before a public meeting in the Civic Hall. At Royal Devon and Exeter Hospital, Sunday, April 22, 3 p.m., Discussion on Negotiation Report of B.M.A. Council and instructions to representatives.

KENSINGTON DIVISION.—At Kensington Town Hall, W., Friday, April 13, 8.30 p.m., Agenda: Discussion on the Negotiation Report of the B.M.A. Council. All medical men in the area of the Division are invited.

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Shrewsbury, Sunday, April 15, 3 p.m., Special general meeting. Agenda: Consideration of Report of Council on Negotiating Committee and Instruction of Representative to Special Representative Meeting. All medical men in the area of the Branch are invited.

SOUTHAMPTON DIVISION.—At Free Eye Hospital, Southampton, Sat., April 14, 2.30 p.m. Agenda: To consider Report of Council on the Negotiating Committee. Members of H.M. Forces stationed in the area of the Division are invited.

WILLESDEN DIVISION.—At Willesden General Hospital, Sunday, April 15, 10.30 a.m. Agenda: Consideration of Report of Council on Negotiating Committee and Instruction of Representative to Special Representative Meeting. All medical men in the area of the Division are invited.

Meetings of Branches and Divisions

GUILDFORD DIVISION

At a special meeting of the Guildford Division held on Feb. 18 the following resolution was passed:

"That this Division, having considered the report from its Representatives to the Annual Representative Meeting, requests that the Agenda Committee of the Representative Meetings be instructed to confer with Representatives of Divisions submitting similar motions or amendments in order to facilitate the co-ordination of the meetings' work."

⁂ The Chairman of the Representative Body comments as follows:

"With reference to the proposal of the Guildford Division, while I, personally, should welcome anything which would 'facilitate the co-ordination of the work of the A.R.M.,' I feel bound to point out, as chairman of the Agenda Committee, that this proposal is highly, if not quite, unpractical.

'Motions' under the most recent standing orders are received up to fourteen days before the meeting. It takes time to collect and arrange and type these motions, and they are laid before the Agenda Committee about twelve to ten days before the meeting. They have to be in the hands of the printer not later than thirty-six hours thereafter to allow of their being sent to Divisions seven days before the meeting. Printing takes time. 'To confer with Representatives submitting similar motions' would mean a meeting with these Representatives which would have to be called at hours', not days', notice; and there is no time even for this. To attempt to confer by post would be quite impracticable.

As regards 'amendments' the position would be worse. These can be handed to the chairman up to the time they are proposed, and obviously the Agenda Committee cannot confer with Representatives on these during the Representative Meeting. The Agenda Committee arranged the order of motions and amendments for the last A.R.M. with the sole concern of facilitating the co-ordination of the work of the meeting, and Guildford Division will, I trust, accept my assurance that this will continue so long, at least, as I am chairman."

CONSULTANT AND SPECIALIST OPINION

A further meeting open to consultants and specialists (see *Supplement*, March 3, p. 34) has been arranged as follows:

Liverpool.—Wednesday, April 18, at 4.30 p.m. at the Liverpool Medical Institution, Mount Pleasant. Mr. J. T. Morrison will open the discussion.

POSTGRADUATE NEWS

A series of special postgraduate lectures has been arranged, under the auspices of the Honyman Gillespie Trust, to be held at the West Medical Theatre, Royal Infirmary, Edinburgh, on Thursdays, at 4.30 p.m., as follows: April 19, Mr. I. S. Smillie, "The Problem of the Stiff Knee-joint in Fracture of the Femur"; May 3, Prof. T. Ferguson, "Employment and Health"; May 24, Dr. C. E. Van Rooyen, "Infective Hepatitis"; June 7, Dr. A. S. Johnstone, "Dysphagia due to Causes other than Malignant Disease"; June 14, Mr. W. Quarry Wood, "Treatment of Duodenal Ulcer"; June 21, Dr. C. Kelman Robertson, "Post-operative Pulmonary Complications." The lectures are open to all graduates and senior students.

WEEKLY POSTGRADUATE DIARY

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m., Mr. I. S. Smillie: The Problem of the Stiff Knee-joint in Fracture of the Femur.

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*Royal Cancer Hospital:* Daily, Revision course in anaesthetics. *London Homoeopathic Hospital:* Sat., April 21, Final F.R.C.S. demonstration of specially selected cases.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—*Tues.* and *Thurs.*, 4.30 p.m., Lumleian Lectures by Dr. Henry MacCormac: Prospect and Retrospect.

ROYAL SOCIETY OF MEDICINE.—*Tues.*, 5 p.m., General Meeting of Fellows. *Wed.*, 2.15 p.m., Section of Comparative Medicine. *Thurs.*, 5 p.m., Section of Dermatology. *Fri.*, 6.30 p.m., Section of Radiology.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. *for* 18 *words or less. Extra words* 3s. 6d. *for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.*

BIRTHS

BARER.—On April 3, 1945, to Gwenda (*née* Briggs) and Capt. Robert Barer, R.A.M.C., B.L.A., a son—Robin Geoffrey.

DANIEL.—On March 28, 1945, at Oxford, to Sarah, wife of Dr. Peter M. Daniel, a daughter.

HATFIELD.—On March 29, 1945, at Ongar House, Ongar, Essex, to Dr. Sylvia Hatfield (*née* Herford) and Dr. F. E. S. Hatfield, a brother (Edward) for Jess and Margaret.

ROBINSON.—On March 29, 1945, at St. Mary's Services Hospital, Adlington Hall, Cheshire, to Mona (*née* Crebbin), S.R.N., and Fl. Lieut. Max W. Robinson, R.A.F.V.R., a son—Peter Jeremy. Both well.

WILLIAMS.—On March 27, 1945, at Q.V.N.I., Wolverhampton, to Marjorie (*née* Ridgers), wife of Squad. Ldr. Bryan Williams, M.R.C.O.G., F.R.C.S.E., a son.

MARRIAGES

GILMORE—ROWLEY.—On April 10, 1945, at Walsall, Terence J. Gilmore, L.R.C.P., M.R.C.S., to Kathleen M. Rowley, B.A.

PICKLES—WOODALL.—On March 17, 1945, at East Wittering, Sussex, Fl. Lieut. A. Nelson Pickles, R.A.F.V.R., to Pauline B. Woodall, V.A.D.

SIMMONS—HUTTON.—On April 5, 1945, at St. Osmund's Church, Salisbury, Dr. A. B. Simmons of Andover to Mrs. Mary Hutton (*née* Radford) of Salisbury.

DEATHS

ALLAN.—On Feb. 4, 1945, at 5, Montacute Gardens, Tunbridge Wells, Alexander Smith Allan, M.B., Ch.B., D.T.M., V.D., Esquire of St John, Major (retired) H.M.I.A.F., late of Calcutta, dearly loved husband of Olive Beale. Cremation was at Charing, Kent, Feb. 8. Burial at Newmilns, Ayrshire, Feb. 21.

MARTIN.—On April 1, 1945, William Beare Martin, M.R.C.S., L.R.C.P., D.P.H., of Old Colwyn, late Tuberculosis Officer, Kent County Council.

O'KANE.—On March 20, 1945, at Mansard House, Watling St. Road, Fulwood, John Patrick O'Kane, M.B., B.Ch., B.A.O., beloved husband of Mildred (*née* Kilroe).

members of the committee only 13 are elected by the group members; the others are not primarily interested in ophthalmology, and before recommendations of the committee can become effective they must be ratified by the B.M.A. Council and the Annual Representative Meeting—two bodies not primarily interested in ophthalmology. (The 1938 Annual Representative Meeting vetoed a recommendation which had the unanimous backing of Group Committees and the B.M.A. Council.)

The Association of British Ophthalmologists, to which none of these objections applies, has 250 members in England, Scotland, and Wales, and has been responsible for most of the changes of benefit to ophthalmologists since its foundation in 1937.—I am, etc.,

London, W.1. PATRICK I. TIERNEY.

SIR,—Ophthalmologists are agreed as to the need for a united body to represent the profession in all its aspects. At present the Ophthalmic Group Committee of the B.M.A., the Council of British Ophthalmologists, and the Association of British Ophthalmologists all profess to be interested in medico-political affairs. It was hoped that the recent negotiations between representatives of the C.B.O. and the A.B.O. would produce the desired body, and general regret will be felt at the apparent failure.

The A.B.O. has not yet decided on its attitude to the proposed Faculty published by the C.B.O., but as a member of its negotiating committee I cannot but fear that this Faculty, instead of uniting the profession, will intensify distrust and make more difficult that unity which is so essential to-day. The circumstances in which this Faculty has been registered, the obvious lack of consideration of detail, and the haste with which it is being foisted on the profession give rise to much uneasiness.

Of the many additional objections which will be raised three may be mentioned: (1) A Faculty is not the proper body to deal with medico-political affairs. A Faculty is generally regarded as an academic body, as witness the recent Faculties of Radiology and Homoeopathy. (2) The proposed Faculty makes no provision for part-time ophthalmologists; the united body that is required not only should deal with ophthalmology in all its aspects but should cater for every section of the profession. (3) The democratic character of the proposed Faculty is in doubt. "The Council shall call an annual general meeting of the Faculty to receive and discuss its reports." Alongside this it is only fair to place a recent decision of the C.B.O.—namely: "Decisions or recommendations of any mass meeting of members or associates should be considered by the council but should not necessarily be acted upon nor implemented."

These difficulties are not insurmountable and I do not despair of the formation of a body acceptable to all parties. To secure this end I write to suggest that another effort be made by calling together representatives, say, four in number, from each of the three bodies—the O.G.C., the C.B.O., and the A.B.O.—and that under an independent chairman they tackle the problem afresh. Meantime the present proposals for a Faculty should be held in abeyance.—I am, etc.,

Glasgow. J. N. TENNENT.

Health Centres and General Practice

SIR,—Dr. A. Garvie's statistical exertions (*Supplement*, Jan. 6, p. 1) seemed hardly necessary to prove that the urge to seek treatment for minor illness varied inversely with the distance to be travelled. Still, no exception can be taken to a scientific approach, providing, however, that the reasoning is valid and no violence is done to facts. In making his main point Dr. Garvie is led to the conclusion that "the segregation of doctors in clinical health centres would reduce the number of patients *they had been in the habit* of seeing and restrict the opportunity of any of them who wished to make a clinical study of aetiology" (my italics). The implication is that doctors had "been in the habit" of distributing themselves evenly over the area drained by the health centre and that segregation would be an entirely new factor introduced by the health centre in local medical practice, causing "increased" inconvenience to patients. The facts are surely far otherwise. In thickly populated areas (which are likely to be the sites of election for health centres) surgeries are invariably found clustered together in close proximity and even contiguity, so that several practice areas not only overlap but often are identical. Even in townships with fewer doctors the majority are likely to be found similarly congregated at the town's centre. In these circumstances there will surely be no question of health centres "*increasing* the average inconvenience to patients."

Scattering doctors "as widely as ever they can be" would, of course, overcome Dr. Garvie's difficulty, though it has yet to be proved that individual practice offers better opportunities for useful statistical research than group practice; but it would be interesting to hear Dr. Garvie's proposals for ensuring this even distribution (not merely regional, but local, and even parochial) without some measure of regulation, seeing that the "free" system enjoyed to-day has failed to achieve this.

As to the importance of statistical validity in minor illness, a sense of proportion must surely be preserved. No system devised by men is ever likely to incorporate every conceivable desideratum (requirements, in any case, change with every generation), and the loss sustained by the deprivation of this particular advantage (it has never really been possessed in the form imagined by Dr. Garvie) must be set against the acquisition of other advantages, perhaps more substantial, that health centres are likely to provide.

In the matter of giving "maximum opportunity to develop some clinical knowledge of aetiology, the development of which is based, first, on a gift of friendship, and, secondly, on an analysis of the date of the sequence of events in many, many lives" (Feb. 17, p. 25) it is at least doubtful whether health centres will afford worse opportunities than the conditions of many, many surgeries of to-day!

Finally, Dr. Garvie's objections would seem to hold against *any* form of segregation, whether in health centres, grouped private practice, or clustered individual surgeries. Why turn his scientific, impersonal argument into special pleading by singling out health centres?—I am, etc.

London, N.W.10. L. PHILLIPS.

DOCTORS' CARS

The B.M.A. has been concerned for some time with the difficulties experienced by doctors in obtaining spare parts for their cars or replacing worn-out vehicles. Without doubt the position is serious. Many cars are being kept on the road long after they would have been relegated to the scrap-heap. They are costly to run and a source of constant anxiety. Doctors are returning from the Services, and new cars will be essential if they are to re-establish themselves in their practices. Used cars are often difficult to obtain; high prices are demanded, and usually no guarantee of reliability can be given. Discussions have taken place with the Ministry of War Transport, and the following is a brief statement of the present position:

REPAIRS

The Minister of War Transport considers it is impracticable to give priority for spare parts and repair facilities to any one category of civilian motorists. Provision is made, however, to ensure that essential vehicles are immobilized as little as possible. A doctor who cannot obtain spare parts from his usual supplier should place an order direct with the manufacturer or his accredited agent, but if no promise of reasonable delivery can be given the doctor should apply to the Regional Maintenance and Certifying Officer of the Ministry of War Transport, c/o the Regional Transport Commissioner, giving full particulars of the parts required and the efforts that have been made to obtain them. The Regional Maintenance and Certifying Officer will then either indicate how the worn parts can be reconditioned for further use, or, if this is impracticable, certify to the Minister of Supply and the vehicle factory the urgent need for the new parts. It will be found that their assistance will materially shorten delays in car repair. Applications to this officer should be sent to the following addresses:

Northern: 41–45, Grey Street, Newcastle-upon-Tyne, 1.
North-Eastern: 44, The Headrow, Leeds, 1.
North Midland: Grosvenor House, Friar Lane, Nottingham.
Eastern: Sussex House, Robson Street, Cambridge.
Metropolitan: Romney House, Tufton Street, London, S.W.1.
Southern: Chiltern Court, St. Peter's Avenue, Caversham, Reading.
South-Western: Beacon House, Queen's Road, Bristol, 8.
Wales: Graham Buildings, Newport Road, Cardiff.
Midland: York House, Great Charles Street, Birmingham.
North-Western: Arkwright House, Parsonage Gardens, Manchester, 3.
South-Eastern: Mount Ephraim House, Mount Ephraim, Tunbridge Wells.

NEW CARS

No new cars are being produced at present for civilian users. The Ministry has given assurance that as soon as new cars are available the B.M.A. will be informed, and a notice will then be published in the *British Medical Journal* stating how priority may be secured. In the meantime, doctors should not be misled by statements to the effect that new cars can be supplied within a short time if a special permit is obtained.

RECONDITIONED CARS

A limited number of cars which are surplus to Service requirements are avail-

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY APRIL 21 1945

HEARD AT HEADQUARTERS

A Matter of Wording

If a comprehensive National Health Service comes about, attention ought to be paid from the very beginning to cerain secondary, but still very important, questions of terminology. Much harm was done by the term "panel patient" in connexion with National Health Inurance. It was rarely used by responible people, and it was, of course, inaccurate, for there never was a "panel" of patients.

In some quarters, in anticipation of he new service, the terms "public patient" and "private patient" are now being used. That, if perpetuated, would uggest a most unfortunate discrimination, and again an inaccurate one, for whether the service is 100% or 90% all patients will be private patients. The appellation "public" suggests something less individual and personal than the doctor's art demands. The terms "free patient" and "paying patient" would be worse still, because all patients will pay. The patients treated within the service will be paying as taxpayers or contributors, or both, the only difference being that they will be paying ollectively instead of individually. Dr. I. B. Morgan, M.P., who is a member of the Council of the B.M.A., made the same point at the recent meeting of Counil, when he said that neither the Government nor organized labour would permit such a discrimination. All patients will be private patients, all will be paying patients.

The Handbook

A valued epitome of the work of the B.M.A. has failed to make its appearance since the war. This is the *Annual Handook,* the last issue of which was in 1938–9. It was intended primarily for the use of Honorary Secretaries and ther workers for the Association, and t contained a large and compact body f information on the constitution and rocedure of the Association and the decisions of the Representative Body.

It is intended to revive the *Handbook* at the earliest opportunity. The first sue will call for something miraculous in the way of condensation, to cover the ap of the last six or seven years. For the moment staff difficulties and paper hortage preclude the immediate preparaon of a new edition, but it is hoped hat it may soon be possible to issue in an up-to-date form that section which consisted of a directory, including the ames and addresses of Honorary Secretaries and the membership of central ommittees.

Psychiatric Services

The report now ready for publication on the future organization of the psychiatric services has had an interesting history. Two years ago the Psychological Medicine Group of the B.M.A. prepared a report on the future of psychiatry, which contained much interesting and valuable material, though there was criticism on the ground that it was not sufficiently complete, and especially that it omitted reference to the part played in psychiatric treatment by the general practitioner.

Eventually it was referred to three standing committees of the B.M.A., and as a result a joint conference was set up on the subject. Meanwhile the Royal Medico-Psychological Association had prepared a concise series of recommendations on much the same lines, and these with the original Group report were taken by the joint conference as the basis for a revised version of the memorandum on the future of psychiatry. Later there was a conference between representatives of the Group Committee, the Royal Medico-Psychological Association, and the Royal College of Physicians—which also had had a committee considering the subject. To this conference the document which had been approved already by the earlier joint conference was submitted and a few amendments were incorporated.

The final report is the production of the Group Committee, the committee of the Royal College, and the R.M.P.A. One feature of this comprehensive document is the emphasis on the close connexion between psychiatry and other branches of medicine, beginning with the general practitioner, who is generally the first to see patients suffering from mental illness.

For and Against

The 100% issue came up time and again at the two open meetings of consultants and specialists called recently by the B.M.A. and the Royal Colleges. One speaker argued that if the 100% principle was accepted there would be no private practice, because people would naturally go to the "State" doctors and get their money's worth, "State" doctors being just as good as "private" doctors. He did not accept the analogy with education. The education provided free by the State was not on the same level as the education which the parent purchased privately for his children, whereas no such distinction could hold good in medicine, where there could be only one level—the best possible service for the patient.

As against this another surgeon put forward the argument that if the 100% went through there would be an almost irresistible temptation to make the "private" service better than the "State" service, so that the only way to ensure that they were equally good was to make the hospital service not available to 100%.

Ex Officio

A criticism voiced more than once at the consultants' and specialists' meetings was that it would be a misfortune to have the Presidents of the Royal Colleges *ex officio* members of any Central Health Services Council to advise the Minister, the reason being that it would determine the election to those great offices on political grounds, whereas academic and personal considerations should govern such elections. The best politician, it was said, would be certain to be chosen, possibly to the detriment of the office.

As an onlooker it seemed to me that there might be something in the argument. On the other hand, there, present in person, were the Presidents of the Colleges, both of them, like their immediate predecessors, remarkable for political acumen.

The Ministry of National Insurance

Just when the complaint is made that the health functions of the Government are spread over so many different Departments, the setting up of a Ministry of National Insurance might be expected to create yet another diversion. From a letter sent to insurance committees by the Minister of Health, however, it appears that although certain of his functions have been transferred to the Minister of National Insurance, these do not touch the administration of medical benefit or the constitution and functions of insurance committees. They relate to the administration of cash benefits of deposit contributors. Accordingly, no amendments are necessary in the regulations governing medical benefit, and insurance committees will continue to be associated with the Minister of Health and not with the Minister of National Insurance.

Regional Medical Service Partially Restored

The insurance regional medical service in England and Wales is to be restored on a restricted scale at an early date. There cannot, however, be the same volume of references as there was before the war. It is suggested in an official circular that the number of references by an approved society each month should not in general exceed 50% of those made monthly during 1938, and for the time being it will not be possible to deal with references relating solely to a woman's function to carry out unaided the ordinary daily work of a house, nor with references on Form R.M.4. A list of towns where it will be possible to hold sessions will shortly be issued; it will not include some of the towns in the more sparsely populated districts where sessions were formerly held.

The number of regional medical officers before the war was 32, and of deputies, 30.

able. These, after being reconditioned, may be obtained by those whose claims for priority are accepted, through a dealer at prices which are not unreasonable compared with those prevailing in the used-car market. These reconditioned cars are subject to a three-months guarantee. A form of application for a permit to obtain one of these cars should be sent to the Ministry of War Transport at 2, Fitzmaurice Place, Berkeley Square, London, W.1. The application should be accompanied by full particulars, including condition of the car at present in use, its age and total mileage, steps already taken to replace it, and evidence that the use of a car is essential if an adequate service is to be given to patients.

The Ministry is willing to give a high degree of priority to doctors, but as the demand is likely to be very much greater than the supply permits can only be granted where the applicant has established a strong case. Every care will be taken to discriminate fairly between rival claims.

H.M. Forces Appointments

ARMY

Col. (Temp. Major-Gen.) H. C. D. Rankin, C.I.E., O.B.E., V.H.S., late R.A.M.C., having completed four years in the rank of Col., is retained on the Active List (supernumerary).

Col. R. A. Hepple, O.B.E., M.C., late R.A.M.C., having attained the age limit for retirement, is retained on the Active List (supernumerary).

Lieut.-Cols. A. R. Ross and H. C. Godding, M.C., from R.A.M.C., to be Cols.

War Subs. Lieut.-Col. (local Brig.) R. Lees has relinquished the local rank of Brig.

War Subs. Major (now War Subs. Lieut.-Col.) R. M. B. MacKenna, R.A.M.C., to be a Consultant, and has been granted the local rank of Brig.

ROYAL ARMY MEDICAL CORPS

Major (War Subs. Lieut.-Col.) G. Anderton to be Lieut.-Col.

Major R. J. G. Hyde to be Lieut.-Col.

Short Service Commission.—Lieut. (War Subs. Capt.) M. G. Jackson-Smyth, from Emergency Commission, to be Lieut., and to be Capt.

REGULAR ARMY RESERVE OF OFFICERS

Major-Gen. H. C. R. Hine, C.B., D.S.O., Cols. F. R. Coppinger, O.B.E., J. A. Renshaw, and G. F. Dawson, M.C., late R.A.M.C., having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers.

Col. W. L. E. Fretz, late R.A.M.C., having exceeded the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. E. F. W. MacKenzie, O.B.E., M.C., Majors A. P. Draper, M.C., and A. G. G. Thompson, and Capt. W. P. Mulligan, O.B.E., having attained the age limit of liability to recall, have ceased to belong to the Reserve of Officers.

Majors J. H. Pendered, M.C., and N. T. Whitehead, M.C., having exceeded the age limit of liability to recall, have ceased to belong to the Reserve of Officers.

Major C. K. G. Dick, M.C., has relinquished his commission on account of disability.

Capt. (Brevet Major) A. K. Forbes, M.C., has relinquished his commission on acount of disability, and has been granted the honorary rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

War Subs. Major R. K. Debenham, O.B.E., to be a Consultant, and has been granted the local rank of Brig.

TERRITORIAL ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. D. L. Greig has ceased to belong to the Reserve of Officers on account of disability, and has been granted the honorary rank of Major.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capts. I. S. Stewart and L. Brill have relinquished their commissions on account of disability and have been granted the honorary rank of Major.

War Subs. Capts. A. D. Chisholm, J. J. Geary, and J. Kelly have relinquished their commissions on account of disability and have been granted the honorary rank of Capt.

War Subs. Capt. J. S. McGillivray has resigned his commission.

Lieut. R. Sepson has relinquished his commission on account of disability, and has been granted the honorary rank of Lieut.

To be Lieuts.: S. H. Moore, T. F. Anderson, O.B.E., J. F. Q. Conolly, A. D. J. B. Williams, O.B.E., C. E. Roberts, W. A. Glynn, A. S. Murdison.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

Relative War Subs. Capts. (Mrs.) C. M. B. Large and (Miss) M. H. E. Long, Emergency Appointments, have relinquished their appointments.

ROYAL AIR FORCE

Air Vice-Mshl. (Temp.) A. F. Rook, O.B.E., K.H.P., has been granted the rank of War Subs. Air Cdre.

The following have been transferred to the R.A.F.O., and called up for Air Force service: Squad. Ldr. R. H. Winfield, Fl. Lieuts. (Temp. Squad. Ldrs.) H. M. Carson, J. M. Clark, J. Crawford, J. D. Jones, C. G. G. Mackay, C. W. S. Morris, H. S. Samuel, F. Summers, R. J. A. Morris, and H. J. Trenchard.

RESERVE OF AIR FORCE OFFICERS

Squad. Ldr. (Temp.) R. F. Courtin has been granted the rank of War Subs. Squad Ldr.

ROYAL AIR FORCE VOLUNTEER RESERVE

Gp. Capts. (Acting Air Vice-Mshls.) C. P. Symonds, C.B., and G. L. Keynes have been granted the rank of War Subs. Air Cdre.

Wing Cmdrs. (Temp.) G. L. M. McElligott, D. H. Brinton, F. W. Roques, R. R. Trail, M.C., T. K. Lyle, and J. F. Bromley have been granted the rank of War Subs. Wing Cmdrs.

Fl. Lieut. (Temp. Squad. Ldr.) H. F. Squire has resigned his commission, retaining the rank of Squad. Ldr.

Fl. Lieut. (Temp. Squad. Ldr.) S. F. Robertson has relinquished his commission on appointment to R.C.A.F.

Fl. Lieut. L. H. Moss has relinquished his commission on account of medical unfitness for Air Force service, retaining his rank.

R. M. Calman to be Fl. Lieut. (Emergency).

Flying Officers M. B. Devas, A. C. C. Davey, J. F. Doherty, L. Goldring, E. G. Grice, R. Halliday, H. W. H. Kennard, D. L. Lisham, T. P. Morley, D. F. Murphy, J. G. Pegg, A. J. H. Rains, H. M. Robinson, B. Cruickshank, W. L. Esler, R. J. T. Gardiner, J. G. Gibson, A. M. I. Gill, J. R. Handforth, R. Summers, I. R. Waters, C. Wood, C. E. R. Wood, and D. G. H. Stone to be War Subs. Fl. Lieuts.

To be Flying Officers (Emergency): B. E. Andrews, J. W. Cowie, K. H. Freeman, F. M. Graham, C. L. Holden, R. A. Hudson, H. P. B. Whitty.

B.M.A. LIBRARY

The following books were added to the library during November and December, 1944:

Berliner, M. L.: Biomicroscopy of the Eye. Vol. 1. 1944.

Boddie, G. F.: Diagnostic Methods in Veterinary Medicine. 1944.

Bossard, J. H. S., and Boll, E. S.: Family Situations. 1943.

Dickson, F. D., and Diveley, R. L.: Functional Disorders of Foot. Second edition. 1944.

Drew, J.: Human Reproduction and Venereal Disease. 1944.

Fulton, J. F.: Physiology of the Nervous System. Second edition. 1943.

Gantt, W. H.: Experimental Basis for Neurotic Behavior. 1944.

Graves, B.: Rational Medicine. 1944.

Handbook of the Royal Naval Sick Berth Staff. 1944.

Hobart, F., and Melton, J.: Concise Pharmacology and Therapeutics. Second edition. 1944.

Lawton, G. (Editor): New Goals for Old Age. 1943.

Layard, J.: Lady of the Hare. 1944.

Levy, H.: National Health Insurance. 1944.

May, C. H., and Worth, C.: Manual of Diseases of the Eye. Ninth edition. 1944.

Minnitt, R. J., and Gillies, J.: Textbook of Anaesthetics. Sixth edition. 1944.

Muller, G. L.: Clinical Significance of Blood in Tuberculosis. 1943.

Murrell, W.: What to do in Cases of Poisoning. Fifteenth edition. Edited by H. G. Broadbridge. 1944.

Newman, Sir George: English Social Services. 1941.

Oakes, L.: A Pocket Medical Dictionary. Sixth edition. 1943.

Pullen, R. L. (Editor): Medical Diagnosis. 1944.

Pye's Surgical Handicraft. Edited by Hamilton Bailey. Fourteenth edition. 1944.

Wolff, E.: Pathology of the Eye. Second edition. 1944.

CONSULTANT AND SPECIALIST OPINION

Further meetings open to consultants and specialists (see *Supplement*, March 3, p. 34) have been arranged as follows:

Southampton.—Saturday, March 24, at 2.30 p.m., at the Royal South Hants Hospital. Dr. R. H. Balfour Barrow will open the discussion.

Newcastle-upon-Tyne.—Thursday, April 5, at 3.45 p.m. for 4 p.m. at the Royal Victoria Infirmary. Mr. John Gilmour will open the discussion.

Sheffield.—Saturday, April 7, at 2 p.m. in the Medical Library, University of Sheffield. Mr. R. St. L. Brockman will open the discussion.

Oxford.—Wednesday, April 11, at 3 p.m. at the Nuffield Research Institute, Woodstock Road. Mr. D. A. Abernethy will open the discussion.

Cardiff.—Thursday, April 12, at 2 p.m. in the Surgical Unit Lecture Room, Royal Infirmary. Prof. G. I. Strachan will open the discussion. This meeting will be followed by a B.M.A. Regional C. and S. Group meeting in the Medical Staff Room, Royal Infirmary.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1) Revision course in anaesthetics, all day, April 9 to 21, lectures and demonstrations at various London hospitals. (2) Final F.R.C.S. week-end course in surgery, all day, Sat. and Sun., April 14 and 15, at Hillingdon County Hospital. (3) Final F.R.C.S. demonstration of specially selected cases, Sat., April 21, 2.30 p.m., at London Homoeopathic Hospital.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*West End Hospital for Nervous Diseases:* Mon. and Tues., 2.30 p.m., Course in neurology (suitable for M.R.C.P.). *London Homoeopathic Hospital:* Wed., 5.30 p.m., Final F.R.C.S. surgery demonstration. *St. Mary Islington Hospital:* Wed., 2.30 p.m., Final F.R.C.S. course.

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE.—*Mon.*, 4.30 p.m., Section of Odontology.

ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE, 28, Portland Place, W.—*Wed.*, 3.30 p.m., Mr. F. W. Pratt: Some Obstructive Abdominal Conditions in Infancy.

B.M.A.: Branch and Division Meetings to be Held

NORTHERN IRELAND BRANCH.—Joint meeting with Ulster Medical Society at Whitla Medical Institute, College Square North, Belfast, Thursday, March 29, 8.30 p.m. Lecture by Dr. H. E. Magee: Some Aspects of Nutrition in Wartime.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s 6d. *for* 18 *words or less Extra words* 3s. 6d *for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.*

BIRTH

FLETCHER.—On March 6, 1945, at the Park Nursing Home, Clarmont Terrace, Glasgow, to Muriel (*née* Frew, M.B., Ch.B.), wife of Capt. A. F. Fletcher, R.A.M.C., L.D.S., L.R.C.S., L.R.C.P., a son—Andrew James Francys.

MARRIAGE

ALMOND—FORSTER.—On March 6, 1945, at Frimley, Major John M. C. Almond, R.A.M.C. (B.L.A.), to Joy F. Forster, 3rd officer, W.R.N.S.

DEATH

LAMPLOUGH.—On March 4, 1945, at Bredon, Alverstoke, Hants, Wharran Henry Lamplough, M.D., aged 66 years.

MEDICAL TREATMENT OF SCHOOL-CHILDREN

Letter to the Minister of Education

The following is the text of a letter, dated April 12, which has been sent by the B.M.A. to the Minister of Education (Mr. R. A. Butler) following the latter's refusal to see a deputation from the B.M.A. on the operation of Section 48 (3) of the Education Act, 1944:

DEAR SIR,—The Association regrets that your many appointments make it difficult for you to receive a deputation from the Association. It was desired to place before you certain important considerations.

Under Section 48 (3) of the Education Act, 1944, there is imposed upon local education authorities the duty of making arrangements to secure the provision of free medical treatment for the school population. At present this section of the community is receiving its medical care from a number of agencies, including the voluntary hospitals, private practice, and the school medical service. To the extent to which medical care additional to that now available is intended, there arises the problem of additional medical, nursing, and other personnel. The plain fact is that additional doctors are not available. Over one-third of the medical profession is serving in His Majesty's Forces, and the Central Medical War Committee is experiencing grave difficulty in satisfying even the minimum needs of the Services without causing a serious deterioration in the medical facilities available for the civilian population. It is absolutely impossible at the present time to extend existing facilities without reducing recruitment to the medical services of the armed Forces below a level consistent with Service efficiency. The Association urges the Minister to recognize this fact and to take any necessary steps, legislative or other, to remove from local education authorities the legal obligation which they cannot, under the present circumstances, satisfy.

It is recognized that in your circular to local education authorities you have advised a slow start. Even so, by advising that in urban areas the form of development should be an elaboration of school clinic and allied services, you are suggesting a procedure which, even where it does not involve additional personnel, is open to the criticism that it may prejudice the initiation and development of a comprehensive medical service. It is clear from the discussions now proceeding between your colleague, the Minister of Health, and the medical profession that the treatment provision for children under a comprehensive scheme will not be based upon a school clinic service. To advise development on these lines now may obstruct future development on lines acceptable to your colleague and to the medical profession. Had your circular advocated the utilization in all kinds of area of the services of general practitioners and others in the accepted way this criticism would not be valid, though there would still remain the insuperable difficulty of the shortage of medical personnel. Neither this nor any other extension of medical services, however desirable, can be made at the present time in view of the unprecedented depletion in the ranks of the medical profession. For this reason the Association would urge upon you, in order that local authorities may not continue to have imposed upon them duties they cannot carry out, and in order that the public shall not be promised something which is unattainable at the present time, to take steps to reconcile the legal position with the hard facts.—Yours faithfully,

(Signed) CHARLES HILL,
Secretary.

LONDON CONSULTANTS AND THE GOVERNMENT PROPOSALS

TWO OPEN MEETINGS

Two open meetings of consultants and specialists in the London area, called by the B.M.A. and the Royal Colleges jointly, were held on April 6 and 9, the first, mainly for those attached to hospitals south of the Thames, at the Royal College of Physicians, and the second, for those attached to hospitals north of the Thames, in the Hastings Hall of B.M.A. House, which was crowded to capacity. Lord Moran presided on the first occasion and Sir Alfred Webb-Johnson on the second. The object of the meetings was to discuss the issues arising from the Government's proposals for a National Health Service. For reasons that have been explained, the principal memorandum on which discussion was based was one which, for the present, by the desire of the Minister of Health, must not be published, although it has been circulated to all members of the profession; therefore much that was said at the meetings must be omitted, and only the general tenor of the discussions can be given.

The first seven speakers in the following account spoke at both meetings, making substantially the same points, and to avoid repetition the reports of the two meetings have been merged into one.

Powers for Regional Councils

Lord MORAN urged that it was very important that any Central Health Services Council which was set up should have real powers; it should not be a reproduction of many old advisory bodies with purely negative functions. Even more important was it that power should be given to Regional Councils—expert bodies—which would have to deal with local authorities. A committee, 93 in number, representative of the Royal Colleges, the B.M.A., the teaching hospitals, and the universities, had unanimously urged that such Regional Councils should be real planning bodies, with advisory power over finance—much in the same way as the King's Fund—and a controlling influence in all consultant matters. The crux of the whole problem was the medical profession's fear of interference by local authorities in clinical work. If the regions were based on university centres, and the planning was done from the centres in such a manner as to afford consultants a voice in the arrangements, they would not be at the mercy of local bodies. So far as negotiations had proceeded, his view was that any substantial concessions had been gained in the field of general practice, not in that of consultant and specialist practice. Nothing would be more harmful than lack of union between general practitioners and consultants.

Sir ALFRED WEBB-JOHNSON concurred in Lord Moran's view concerning the need for investing the Regional Councils with real powers. He explained in what respects, in his view, the Negotiating Committee had and had not achieved its ends. Among the matters which he hoped would still be pressed on the Government were the separation of the medical service from general social insurance, the introduction of the service by stages (the development of the hospital system coming first), and the bringing together of all health services under the Ministry of Health.

Dr. GEOFFREY BOURNE said that it seemed to be assumed that the L.C.C. would be the authority in London fo the purpose of the service. This was body with an inordinate appetite an inadequate powers of digestion. Wh should the consulting service be enveloped in such a "cyst," presently n doubt to become calcified? In an L.C.C committee report on the White Pape presented to and approved by the paren body last October, it was stated: "W feel that no right of nomination o appointment by professional or othe bodies to membership of any appropriate committee of the council charge with the administration of the schem would be acceptable to the council." I other words, they did not trust the doctors; they wanted the politicians to ru medicine in London.

Beginning at the Top

Mr. EARDLEY HOLLAND pointed ou that the Ministry had made no attemp to put its own house in order. Th success of the service would depend o perfect planning, which included planning at the top. The Minister should b responsible for all civilian medical an health services. He added that the profession was inclined to underrate its ow power. It was a very powerful profe sion, and so long as the people realize that it had their interests at heart the would never let it down. If the profession adhered to the 100% comprehensiv principle it would retain the good will o the people, and with that good will the need fear nothing. He regretted a ce tain lack of publicity for the profession case and the tone of some press com ment, and said how glad he was to se that Dr. Hill in the *Times* of April 9 ha countered a recent leading article in th journal.

Dr. MAURICE CAMPBELL said that th profession would be almost unanimo in desiring that a scheme should procee by evolution from what had been esta lished in the past. He hoped that th membership of the Central Health Se vices Council would not be determine by Ministerial nomination, even thoug after appropriate consultations. Was likely that any Minister would reappoi a man who had criticized him? seemed to him that the powers of th Minister were absolute. He might hav all sorts of advisers, but he was at libert to accept, reject, or deal with their a vice in any way he chose, and not on so but to appoint the advisers. A ce tain type of doctor appointed by th Minister might be a more dangero bureaucrat than a layman.

Mr. W. E. TANNER thought that if th scheme of basing the regions on th university centres were brought int operation the L.C.C. would have to fa into line. He urged the production of co-ordinated scheme bringing in th municipal and the voluntary hospital teaching and non-teaching, with a vie to benefiting the public and helping th general practitioner.

Why Secrecy? Why Hurry?

Mr. LAWRENCE ABEL asked the reas for the secrecy in which the discussio were enveloped and the hurry with whic the Special Representative Meeting ha been summoned. The explanation w given that the hurry was due to th approach of a general election. In oth words, the profession was being used a pawn in some Government schem The Negotiating Committee had bee asked to consider a number of resol tions by the Annual Representati

Meeting last December, but no consideration of them had been embodied in the report which had been circulated, and which, in fact, was not a report of the Negotiating Committee at all but a Ministerial document. The Representative Body wanted a scheme built up from the existing scheme of National Health Insurance, not based on the nationalization of medicine or any new and revolutionary principle. Evolution should take place first of all by the plan of the N.H.I. to cover total sickness, and afterwards by the inclusion of dependants and others of like economic status, and if that was done the 100% issue would solve itself. He did not want a position to arise in London similar to that in Berlin, where, before the war, there were 4,000 specialists and 3,000 general practitioners. That came about because of the nationalization—or nazification—of medicine. He believed that this country had the best general practitioners in the world; he did not want them to become merely "male nurses filling up forms" or to take up radiology or skin diseases or some other subject in order to be "bits of specialists." As for the London area, Mr. Abel wanted to see London and the adjoining counties divided into four or six regions. The L.C.C. should not be the "gauleiter" of London. He also deprecated a suggestion that the Presidents of the Royal Colleges should be *ex officio* members of the Central Health Services Council. In the Colleges the Presidents should be elected on their personal and academic qualifications, not because they were good politicians, and it would be as politicians they would be elected if this arrangement came about.

Dr. CHARLES HILL explained that the proposals now under consideration were uch as the Minister would be willing to put before his colleagues as soon as he new whether they commended themselves to the profession. It was not by the wish of the Association that publication of the document was withheld, but the technical position was that the Minister was sounding the profession before e put his proposals to his colleagues in he Government.

Five Points of Insistence

Sir JAMES WALTON thought that there was danger of the London hospitals oming entirely under the control of the .C.C. Was it likely that the L.C.C., aving developed a system of its own, ould hand over the control to certain epartments of the voluntary hospitals? He had talked with the secretaries of arious hospitals and could affirm that y members of voluntary hospitals committees would be entirely in line with edical staffs in their fight for the freedom of hospitals as against county council control. Five points should be insisted upon: (1) That the Central Health rvices Council should provide the inister with the expert view on questions of policy, a power not to be deleted to standing committees with indendent access; (2) direct election to the ouncil, not nomination by the Minister;) Regional Councils to have executive wers; (4) voluntary hospitals in Lonn not to be under a local body; and) the Central Council to have power publication of its reports.

Dr. GERALD SLOT pointed out that a rge number of consultants were enged by the L.C.C. on a sessional basis. r his own part he had not experienced the difficulties in municipal service of ich others had spoken. Taken by and large, the L.C.C. had not been a bad employer of medical labour. It had done a great deal to enlarge its hospitals and improve its services, and it would probably have no difficulty in recruiting from returning consultants an adequate number for its purpose. The existence of a large number of consultants in the Services must be borne in mind; many of these men had lost their practices and connexions and were without private means, and they would be prepared to earn their living in the service of local authorities until they had again built up their practices.

Mr. V. E. NEGUS said that if a region was to have any value or meaning there must be co-ordination of services within it, otherwise each area within the region would go to work on its own. It seemed illogical that London should be a single region; it would consist of an urban population without rural districts. The better plan would be to have at least four regions covering London and surrounding counties, each embracing a certain rural area. Mr. E. G. SLESINGER also urged that the power of planning should not be left at the lower level. He agreed with other speakers in saying that before they assented to an administrative structure they should know what the new service would be like. Mr. MCADAM ECCLES suggested the drawing up of certain basic statements which could be put to candidates of all colours at the approaching general election. Other participants in the discussion were Mr. FRANK LAW, Mr. F. G. LOUGHNANE, Mr. WATSON-JONES, Dr. NOAH PINES, and several more.

Solid Achievements

Mr. H. S. SOUTTAR said that the Negotiating Committee had been too modest. There was some danger of underestimating what it had achieved. He had been concerned for the last five years in the discussions on these questions, and had watched the gradual development of the scheme. One important concession which the committee had extracted from the Minister was a promise that whatever scheme was brought forward there would be no interference whatever with complete freedom for private practice. How to implement that was another matter, but the promise was there in the plainest terms. Concerning the 100% issue, he thought it impossible to escape it, if only for this reason: that the whole community would have to pay for the service, the cost of which would be borne mainly by taxation, so that it would be impossible to exclude any taxpayer who wished to avail himself of it. The proposals now before the profession, if carried out with good will on both sides, offered a great future for medicine in this country, and he had enough confidence in the good will of Parliament and the common sense of the medical profession to believe that they would prove successful.

Sir ALFRED WEBB-JOHNSON, in closing the second meeting, over which he had presided, remarked that he thought they were getting near to an administrative structure which would be acceptable to the profession. To insist that the Minister in seeking advice should accept advisers who were chosen for him was open to objection from the other side, particularly when, with the same voice, the profession proclaimed that everybody in the country must have free choice of doctor!

POSTGRADUATE TRAINING FOR SERVICE M.O.s

A scheme of postgraduate training for medical officers released from the Forces is announced by the Ministry of Health and the Department of Health for Scotland. An outline of the plan, issued by the Departments concerned, is printed below. The Service Departments are making the scheme known to serving medical officers. Some editorial comment will be found in the *Journal* (p. 562).

NEED FOR REFRESHER COURSES

The Government recognizes that many medical officers who joined the armed Forces during the war were unable to complete the postgraduate training usually received before entering civilian practice, and that others have had their normal professional experience interrupted or curtailed in certain important respects over a period of years. It is clearly most important that every possible opportunity should be given to medical officers when they are released from the Forces to continue their training, or to bring up to date their professional knowledge, in those branches of medicine required in civilian practice. Accordingly, after consultation between the Ministry of Health, the Department of Health for Scotland, the universities, and other interested bodies, arrangements are being made—of which it is hoped that officers on release will avail themselves to the greatest possible extent—for the provision of further training or refresher facilities.

Classes of Officers Concerned

The following are the classes of officers concerned:

1. Those who joined the Forces within a year or so of obtaining a medical qualification, including those who joined the Forces after obtaining a diploma and would normally have proceeded to take a university medical degree, but were prevented by their recruitment from doing so.
2. Those who had become established in general practice before they joined the Forces.
3. Those who were training for a specialist career when they joined the Forces or are accepted as suitable for such training on release.

The Scheme in Outline

Class 1 will be offered resident salaried posts for up to six months at teaching hospitals or other hospitals approved by the universities, where they will have access to suitable clinical material and work under the guidance of senior members of the visiting staffs. Alternative arrangements may be adopted by certain universities in Scotland. For Class 2 refresher courses will be arranged at hospitals approved by the universities. For Class 3 there will be posts of the "registrar" type in teaching and other hospitals approved by the universities where they can continue their specialist training.

Procedure

A medical officer in any of the above classes should, on his release, apply personally or in writing to his university or medical school, or to the university nearest to where he is living, or to a central office to be set up by the University of London which will act not only for all the London medical schools but also as a clearing house for England and Wales. There will also be an associated Scottish clearing house set up c/o The Dean of the Faculty of Medicine, The University, Edinburgh. At each university a committee for postgraduate medical education is being formed, with a dean or director, to assist officers on release from the Forces, and their addresses and that of the central offices in London and Edinburgh will be published in the medical press or can be obtained from the Ministry of Health, Whitehall, London, S.W.1, or Department of Health for Scotland, St. Andrew's House, Edinburgh.

The Class 1 applicant will then be considered for a suitable hospital post, and, if there is no post vacant at a suitable hospital within the normal establishment, the creation of a post additional to the establishment will be considered. Those who qualified on a diploma and now wish to proceed to a university medical degree will be placed so far as possible at teaching hospitals.

For Class 2 a refresher course will be arranged by the university at a suitable hospital where sufficient clinical material and suitable staff are available for instruction and demonstration. These courses may be either concentrated into a period of 2 weeks, or spread over a period of about 3 months on, say, 2 afternoons a week. They would be available at any time within a year of the practitioner's release.

The requirements of Class 3 will be met partly within existing vacancies, and partly by the creation of new posts which will be set up in accordance with the recommendations of the Goodenough Committee.

Finance of the Scheme

The posts available to Class 1 will mainly be junior "B1" posts at the rate of £350 per annum, plus board and lodging or £100 in lieu. In the case of those with family commitments, assistance under the "Further Education and Training Scheme" may also be available. An officer not holding a salaried hospital post—e.g., an officer studying for a qualification such as the D.P.H.—would usually be eligible for such assistance. The refresher courses for Class 2 would be free of cost, and travelling and subsistence expenses, together with the expense of paying a locumtenent where necessary, would be repayable up to a specified maximum. The posts available for Class 3 would usually be senior "B1" posts at the rate of £550 a year plus board and lodging or £100 in lieu.

Further details will be available on inquiry in due course.

DOMICILIARY NURSING IN LONDON

The thirtieth annual meeting of the Central Council for District Nursing in London, a body which includes more than eighty affiliated associations, held its annual meeting in London recently, when Sir William Collins, who has guided its affairs ever since its formation, was re-elected president, and Sir Stanley Woodwark and Miss Zoe Puxley vice-presidents. In addition to its ordinary work the Council undertakes public assistance nursing for the London County Council, and during the five quarters with which the annual report dealt the nurses paid 180,212 general nursing visits to L.C.C. patients, as well as 128,831 visits for insulin administration.

The reference in the Government's White Paper to a full home nursing service as one of the improvements to be brought about, so that all who need nursing attention in their own homes may be able to obtain it without charge, has been the subject during the year of conference between the Central Council and other nursing bodies and the Ministry of Health. The Central Council has pointed out that if, as the White Paper states, the responsibility for this complete nursing service is to be exercised by the individual county and county borough councils, the scope of which would go beyond the facilities at present available, there would be an obligation to make use of the existing voluntary organizations as much as possible. It was confirmed at the conference with the Ministry of Health that there would be such an obligation upon the local authorities and that the voluntary service organizations would receive in return a grant from public funds.

Correspondence

100% Service

SIR,—It is regrettable that in their recommendations on the 100% service the B.M.A. Council stands out for the rights of the patient to obtain medical attention for a fee from another doctor on certain occasions. Under the National Health Service every citizen is of right entitled to free medical attention. To let the patient go privately to another doctor will reintroduce a dangerous differentiation between public and private cases, which will be detrimental to both doctor and patient. The public will retain the impression that money can buy better service, and the doctor will be tempted to give more attention and time to these private patients than to his "public" ones. Two standards of medicine, public and private, may thus undermine the strength of the new service and the confidence of the people.

In my view, unless the National Health Service is 100%, with complete abolition of all private fees, there can be no great advance in the medical service. The doctor should always give of his best to every citizen, rich or poor, and should scorn to accept the rich man's bribe. Only if there are no private patients will the public be sure that there is really one service for all.

The patient must be free to change his doctor if he is dissatisfied with him, and he must be free to demand a second opinion, but he must not be allowed to waste money on private consultations. The doctors must be deterred from exploiting such ignorant folly. It is rightly a condition of service in most public health jobs that the doctor accepts no fees from any patient, however wealthy he may be. This principle should be applied throughout the National Health Service—the best for all and all for the best.—I am, etc.,

WILLIAM D. GRAY,
Asst. T.M.O., Durham County Council.

A Fundamental Point

SIR,—Although I pay a tribute to the great work of our negotiators and the efforts they are making to obtain the best service possible, there is one fundamental difficulty, which, if it is not possible of solution, renders their work quite useless. Are there any safeguards to prevent another Minister or another Government altering our conditions of service or our pay in any way they choose without our consent? We have had it before. The continual wrangles with the Government over the capitation fee, the bringing of "the £420s" into the panel without even any notice, show us clearly what a Government is capable of, and there are plenty of other examples. We can never put our trust in future Governments or Ministers, however much we may feel that the present administrators are endeavouring to give us a fai deal.

Unless our negotiators can give u some guarantee that the conditions o service and pay will not be altered in th future without our consent—and personally I do not see how they can because the present administration wil say it cannot bind any future administration—I am sure our right course is t refuse altogether to have anything to d with a Government medical service, however good it may appear, and to give thi as our reason. If the whole professio would come to realize this fundamenta point, the Government would have t drop the scheme as it could not work i without our co-operation.—I am, etc.,

Acocks Green. L. LEIGH HADLEY.

Medical Demobilization

SIR,—Judging by the letters on thi problem which you have published recently from medical officers in th Services, the feature which gives the most concern is the allegedly large number of fit young men who have dodge the Services and are busily engage acquiring higher degrees and valuab experience in E.M.S. and other hospital I have difficulty in reaching a reasone opinion on this matter in the absence accurate information. One must suppo that the information on which the officers in the Services base their complaint must be largely of the hearsa variety, and, especially in the case those who write from over-seas, canno in the nature of things, be either accura or up to date.

To clarify the matter and in justice all concerned could we not have a official statement from the Centr Medical War Committee? As the Secr tary of a Local Medical War Committ which has had the unenviable task selecting men for call-up I feel that t profession as a whole is entitled to kno how many men under 35 years of a have had more than two years in hospit appointments following qualification, a of these how many are physically fit f the Services.—I am, etc.,

Stirling. W. LESLIE CUTHBERT.

Demobilization and the E.M.S.

SIR,—You recently published a let on this subject from Major T. Armstrong and Major S. A. Maddoc (Dec. 30, 1944, p. 869), serving ove seas, in which they pointed out th objections to the proposal that, when time eventually comes for release fr the R.A.M.C., civil service in the E.M should count as military service those who first served in the E.M.S. a were then posted to the Services. N that it appears possible that the war Europe will terminate before the w against Japan, officers of the R.A.M. serving over-seas are beset with apprehension that they will not be leased when the war in Europe is ov and that they will be retained for service abroad in Europe or elsewhere. The members of the E.M.S., on the other hand, who have remained at home throughout the war, and who have had the opportunity for postgraduate study, will be available for the many appointments which will probably be filled soon after the hostilities in Europe have ceased. It cannot be denied that the young men who have spent their time in the E.M.S. have had great personal and professional advantages as regards medical work, domestic amenities, and home comforts, over their self-sacrificing brethren who have served in the Forces over-seas—each with only his conscience to console him. Further it would now appear only fair that these young men in the E.M.S., who for so long have "sat pretty," should go over-seas and release the Service officers, thus enabling them to return and obtain the benefit of postgraduate work in England.

Quotations from letters I have received on the subject from R.A.M.C. officers abroad will serve to illustrate their point of view. The first is from a physician who was in France before Dunkirk, and has subsequently served in Africa and Italy. He writes: "There appears to be very little understanding amongst the E.M.S. authorities of the feelings of M.O.s over-seas. I must admit that after 5½ years in the R.A.M.C., the prospect of another 2 or more, spent, say, in India or Burma, fills me with despondency." The second, who was about to specialize at the outbreak of war, writes: "We have been told by the War Office that we are unlikely to be released soon after the European war ends as there is considerable opposition to the calling up of men from the E.M.S. A further term of 5 years in the Army is a gloomy prospect for us, and an even gloomier prospect for our future as doctors. It seems to me that E.M.S. men of the right age will have to come in, or we shall be in the Army for life!"

In all conscience their protest seems well grounded, and as lovers of justice we must be astonished at their moderation.—I am, etc.,

London, W.1. G. E. Beaumont.

Time for a Change

Sir,—Mr. T. B. Layton's letter (*Supplement*, March 24, p. 44) is disturbing, for it suggests that resentment against their colleagues in the E.M.S. is widespread among Service M.O.s. I believe that I speak for the majority of full-time members of the E.M.S. when I declare that we have always been anxious to bear our responsibilities to the full. The relative requirements of the various theatres of operations are known only to those who direct our medical services, and I think that since 1939 they have been kept aware of our desire to serve where we are most needed.

Unfair distinctions are unfortunately an inevitable accompaniment of war, and we in the E.M.S. fully realize that in many ways we have been more fortunate than our colleagues who have been posted over-seas. It is only right, therefore, that it should be stated plainly that we are ready to play our part in any exchange system which may be devised. Obvious difficulties will have to be faced; I need mention only one. Civilians and returning Service sick must be cared for and; needless to say, most hospitals are short staffed. The three emergency hospitals to which I am attached deal exclusively with military patients, but to learn the administrative details of my post would take a Service M.O. at least three months; it has taken me five years to acquire a sound knowledge of my job. Similarly it would take me several months to learn to pull my full weight in the Forces. My post cannot be relinquished until a successor has been trained; his cannot be left until I have been trained. When, and if, a solution can be found I trust that the other Services will discover that after all the spirit of the E.M.S. is not unwilling. —I am, etc.,

Lichfield, Staffs. Clifford G. Parsons.

Calling a Halt

Sir,—The correspondence columns of the *Supplement* seem to be rapidly degenerating into an outlet for "grouses," often characterized more by ill temper than regard for accuracy, and Dr. W. H. Hayes (April 7, p. 53) has done good service by making a protest. Nothing but ill feeling can be promoted by a correspondent who, in successive paragraphs, implies without offering a scrap of evidence: (*a*) that there is an appreciable number of doctors "who are deliberately avoiding service in the Forces"; and (*b*) that "medical officers in the E.M.S. are, in the majority of cases, *not* in the Services." Has "A Medical Officer, R.A.F." (March 17, p. 41) nothing better to do with his time than to produce this sort of innuendo?

Then Dr. W. Lees Templeton (April 7, p. 53) brings out the old jibe, usually offered to us public health doctors, that no Government servant, "medical or otherwise, would work outside office or school hours"! During recent years I have had a good deal to do with "Government medical servants," and although I have fiercely disagreed with them on more than one occasion I have yet to find one that did *not* work outside so-called office hours.

"Ex-Service M.O." (April 7, p. 54) makes the remarkable assertion that a man who has been classed as unfit for Service "is not a suitable person to hold a permanent post." He must have a very untidy mind or have already forgotten that in the Services a medical officer is required to be fit enough to undergo all or any of the training and exertion under fighting conditions required of the ordinary fighting man. There are many doctors "unfit for general service" who are perfectly capable of doing public health work, and doing it well.

No, Sir, this bickering gets us nowhere. There are sufficient attacks being made upon the credit and independence of the profession without our enemies receiving assistance from within our ranks.—I am, etc.,

Lewes. Frank Langford.

Salaries of Whole-time Medical Officers

Sir,—The Rushcliffe scheme has now been in operation for two years. In spite of several letters to the *Journal* the B.M.A. appears to have done little. At my hospital the matron gets more than the deputy superintendent (M.A., M.B., Ch.B., M.R.C.P., D.P.M.). The state of the other medical officers, all specialists with a D.P.M. and several with higher qualifications, I leave to your imagination. This is, of course, characteristic of the political governing body, which does not expect many votes from medical men. The result, it should be unnecessary to point out, obviously the gross deterioration of the service and a mess which will have to be cleared up when suitable control is established, if ever.—I am, etc.,

Thomas Lindsay,
Member of the Psychological Medicine Group Committee.
St. Lawrence's Hospital, Caterham.

⁂ The Secretary of the B.M.A. states: "The Association has given to the appropriate bodies, as from April 1, 1945, the prescribed period of one year's notice to terminate the Askwith Agreement on March 31, 1946."

Medical Witnesses

Sir,—In your issue of Feb. 24 (p. 27) under the heading "Medical Witnesses" reference was made to the inadequacy of fees. I should like to add my experience of "waste of time" at the Central Criminal Court only a week or two ago.

I was subpoenaed to attend there to give medical evidence for the defence in a case of criminal assault, the session commencing on Feb. 27, the actual day to be notified to me later. On Feb. 28, shortly after 9 a.m., I was warned to attend at 11 a.m. as my case was first on the list. I duly appeared in court to find the jury already sworn in, and my case apparently about to start, when suddenly the procedure was altered, and undefended cases were taken—the jury being now unnecessary. After 1½ hours the jury were dismissed until the afternoon, and I was told I would not be required until then. I appeared again at 2.5 p.m. and waited about until 3.15 p.m., when I found that my case would not be heard until Friday at 11 a.m. I again appeared in court on Friday and experienced the same delays as on Wednesday, until, at 3.15 p.m., I was informed that, the charge having been altered, my evidence would not be required.

This case was defended under the Poor Persons Act, the maximum fee for a medical witness being 1½ guineas. I applied for a further fee for the second day's attendance, but this was not allowed. I leave you to imagine the havoc all this caused in my practice as regards appointments, visits, and surgeries—all for 1½ guineas. I have no partner or assistant.—I am, etc.,

L. T. Simson.

BRITISH MEDICAL ASSOCIATION

Meetings of Branches and Divisions

North of England Branch

SCIENTIFIC MISCELLANY

A course of scientific meetings, arranged jointly by the North of England Branch of the B.M.A. and the Newcastle and Northern Counties Medical Society, was held in Newcastle-upon-Tyne in October and November, 1944.

In an address on peptic ulcer at the first meeting Prof. C. F. W. Illingworth discussed the marked increase in perforation of peptic ulcer in the past few years. This increase did not coincide with the extensive bombing of the "blitz" period; his own view was that the major factors responsible were worry, fear, and overwork, particularly the latter. He gave statistics showing that peptic ulcer was least frequent in the months of August, September, and October—the holiday season and the period immediately after the usual annual holiday. The commonest day of the week for the incidence of perforation was Saturday and the commonest hour of the day between 5 and 6 p.m. Incidence of perforation was low on Sunday and Monday—i.e., immediately after the week-end break. Occupational incidence was not as marked as was generally believed, though irregular hours and hasty meals were responsible to some extent. Discussing the results of medical and surgical treatment he showed that there was little or no difference between the two. Peptic ulcer, though perhaps not more frequent, was certainly more fatal in the lower social classes, and he attributed this to the less adequate arrangements for rest, general care, diet, and care in the home.

Surgery in the Forward Areas

Major John Swinney chose for his subject at the second meeting "Assault in the Mediterranean with a Surgical Team." He briefly outlined his journeys through Sicily and Italy with the invading troops, and described the setting up of a surgical unit in a farmhouse near the shore of Sicily. The latter included an account of how this surgical unit went to work, its modifications for surgical purposes, and some of the cases treated there in the early stages of the invasion. The chief problems in the forward area were: (1) Treatment of shock. (2) Prevention of death from haemorrhage. (3) Prevention of sepsis. He emphasized the value of wet and dry plasma and of stored blood being available in the forward areas. As regards sepsis, the position in Sicily and Italy was different from that in the desert, and gas gangrene was more prevalent and was one of the major problems. He stressed the need for a more formal excision of wounds; excision of the skin should always be minimal. He condemned primary wound suture. Reviewing the lessons learnt in the treatment of soft-tissue wounds by the application of plaster and the value of Tobruk plaster and its various modifications, he pointed out that these plasters were designed as temporary measures to allow easier evacuation of the patient to base, and were not designed for the permanent correction of any bony deformity. Major Swinney did not think the time was ripe for a positive assessment of the value of penicillin.

At the third meeting Dr. C. E. Kellett gave an address on "Descartes and the 'Man Machine'." Sir Edmund Spriggs chose "The Colon" as his subject at the fourth meeting, and devoted the greater part of it to considering the three symptoms: flatulence, constipation, and the presence of blood in the stool. Flatulence was, he added, the commonest complaint of people with abdominal trouble, and the term covered eructation of wind, the passage of flatus, bowel distension or a feeling of distension, and borborygmi. Many patients who had no bowel delay complained of constipation, but only those suffering from demonstrable bowel delay required treatment. To detect blood in the stool the motions should be examined daily.

Peptic Ulcer: A Danish View

Dr. Gunnar Alsted at the fifth meeting said his remarks on the diagnosis and treatment of peptic ulcer represented his personal conclusions after intensive investigation over a period of ten years and the general views of the Danish School. Peptic ulcer was looked upon as a group of diseases—the ulcer group—which included ulcer of the body of the stomach, the juxta-pyloric ulcer, the duodenal ulcer, and gastro-jejunitis. Only in the case of juxta-pyloric ulcer could a reliable diagnosis be made on clinical examination. The principles of treatment in the uncomplicated ulcer were to protect the stomach from the mechanical irritation of food by giving a purée diet—from which minced meat was not excluded—to order rest in bed, to forbid smoking, and to give magnesium trisilicate or hydroxide. Histidine had not proved so helpful as had been hoped. Surgical treatment was reserved chiefly for cases relapsing at least three times under adequate medical treatment, and perforated ulcer cases.

At the last meeting Dr. W. F. Harvey spoke on the diagnosis and description of cancer. His remarks were based upon a study of 1,943 tumours investigated personally. He described the collection, preservation, and preparation of specimens for biopsy, and the classification and description of the individual slides. He considered the adoption of the simple terminations, -blastoma, -cytoma, and -oma, to denote carcinoma and sarcoma, the simple counterparts of these tumours and tumour growth respectively, would obviate much confusion and simplify classification. The description should take the form of a report of scientific and clinical value giving differential diagnosis and negation when necessary. It should also incorporate a personal deductive approach to the verdict, and information regarding sepsis, rate of growth, and radiosensitivity when relevant. Carefully recorded and classified statistics were of great value in trial of alternative methods of treatment.

Each lecture was preceded by clinical demonstrations which were given by Dr. T. H. Boon, Dr. Wm. Hunter, Mr. John Brumwell, Mr. C. F. Rowbotham, Mr. J. S. Arkle, Mr. A. MacRae, Mr. J. Gilmour, Dr. S. Whately Davidson, Dr. C. N. Armstrong, Dr. A. G. Ogilvie, Mr. T. A. Hindmarsh, Prof. F. J. Nattrass, and Mr. H. Harvey Evers.

Branch and Division Meetings to be Held

Macclesfield and East Cheshire Division.—At West Park Hospital, Sunday, April 22, 11.30 a.m., Annual meeting of Division; 12 noon, Annual meeting of practitioners to elect Local Medical War Committee.

Shropshire and Mid-Wales Branch.—At Royal Salop Infirmary, Shrewsbury, Tuesday, May 1, 3.30 p.m., B.M.A. Lecture by Dr. Frank S. Airey: "Skin Diseases in General Practice." A cordial invitation to attend is extended to all doctors in the area

H.M. Forces Appointments

ARMY

Col. W. E. Tyndall, C.B.E., M.C., late R.A.M.C., has been granted the local rank of Major-Gen.

ROYAL ARMY MEDICAL CORPS

Lieut.-Cols. G. D. Yates and L. M. Rowlette, D.S.O., M.C., having attained the age for retirement, are retained on the Active List (supernumerary).

Majors (War Subs. Lieut.-Cols.) P. F. Palmer and D. Bluett, O.B.E., to be Lieut.-Cols.

Short Service Commissions.—Lieuts. (War Subs. Capts.) F. G. Neild and N. J. Y. Simpson, from Emergency Commissions, to be Lieuts., and to be Capts.

REGULAR ARMY RESERVE OF OFFICERS

Col (Hon. Brig.) J. S. McCombe, D.S.O., late R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

LAND FORCES: EMERGENCY COMMISSIONS

Royal Army Medical Corps

War Subs. Major W. B. Swete-Evans has relinquished his commission, and has been granted the honorary rank of Lieut.-Col.

Major R. S. Townsend, M.C., late Col., I.M.S. (ret.), has relinquished his commission on account of disability, and has been restored to the rank of Col., I.M.S. (ret.), on ceasing to be employed.

War Subs. Capt. M. J. Hilton has relinquished his commission on account of disability, and has been granted the honorary rank of Major. (Substituted for the notification in a *Supplement* to the *London Gazette*, dated Feb. 13.)

War Subs. Capt. I. Pugh has relinquished his commission on appointment to the S.A.M.C.

War Subs. Capts. I. Margolin, H. Gremson, A. I. Clein, G. L. Hermitte, and J. Newcombe have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

War Subs. Capt. B. A. Coghlan has relinquished his commission, and has been granted the honorary rank of Capt.

Lieuts. P. H. Stone, J. R. C. Spicer, W. A. S. Lamborn, O.B.E., and E. G. Gibbins have relinquished their commissions and have been granted the honorary rank of Lieut.

Lieut. E. Sorabjee has resigned his commission and has been granted the honorary rank of Lieut.

Lieut. C. H. Philips has resigned his commission.

The following Lieuts. have relinquished their commissions: R. M. Dowdeswell, J. M. Liston, R. H. Wiseman, and D. G. Snell.

To be Lieuts.: G. J. Roberts, M. D. Froud, E. J. G. Wallace, J. K. Meiring, J. O. S. Anderson, J. A. Chestnutt, W. R. Cole, P. J. Collard, E. R. Corbett, P. J. W. Corser, W. C. Crawford, J. A. Eadie, P. M. Edis, E. Gancz, M. G. Gould, R. J. A. Heron, F. W. Hill, G. R. F. Hilson, H. B. Jacobs, A. V. Lillywhite, V. D. Logue, G. M. McEwan, D. R. Mackintosh, H. G. Middleton, L. P. A. Newborne, J. D. O'Flynn, D. V. Pleasant, D. Ranger, J. F. Rees, H. H. Robinson, P. M. Rooze, L. W. Russell, H. W. Stark, N. J. Townsley, W. V. Wadsworth, C. E. M. Wenyon, E. C. B. White, G. F. Bramley, W. R. Ashby, M. Bates, H. McC. Carson, D. G. Conacher, E. H. Couper, F. R. Curtis, A. S. Davidson, A. W. Edrdge, R. W. Fynn, S. P. Higham, A. Hill, M. R. Hunt, P. H. Jones, J. H. Kitson, I. B. Lawrence, T. J. Laszlo, A. Levin, G. M. Ligertwood, H. MacC. MacIntyre, J. W. McAllan, A. McPherson, H. C. Milligan, T. S. Moore, C. P. Moxon, E. E. P. Murray, R. C. Nimmo-Smith, R. E. P. Nutten, J. S. Oldham, R. S. Powell, J. F. Riley, R. T. Ritchie, J G Robson, J. Roberts, C. F. Rolland, G. A. H. Sandilands, J. H. S. Scott, I. McG. R. Scroggie, R. A. Y. Stewart, J. Tudor, J. Vaughn, G. A. S. Wallace, F. C. Williams, I. W. Winchester, and W. T. C. Wilson.

ROYAL AIR FORCE

Wing Cmdr. R. J. Aherne, M.C., has reverted to the Retired List, resuming the rank of Gp. Capt.

Wing Cmdr. (Temp.) J. F. Sandow, O.B.E., has been granted the rank of War Subs. Wing Cmdr.

Fl. Lieuts. (Temp. Wing Cmdrs.) A. S. Amsden and H. D. Conway to be Squad. Ldrs.

Fl. Lieut. (Temp. Squad. Ldr.) E. H. Lamb has been transferred to the R.A.F.O., and called up for Air Force service.

H. A. N. Hamersley has been granted a short service commission in the rank of Flying Officer, and seconded to the Royal Hampshire County Hospital.

Auxiliary Air Force

Fl. Lieut. R. G. Smith has relinquished his commission on account of medical unfitness for Air Force service, retaining the rank of Squad. Ldr.

Reserve of Air Force Officers

Squad. Ldr. (Temp.) G. A. Baker has been granted the rank of War Subs. Squad. Ldr.

Royal Air Force Volunteer Reserve

Fl. Lieut. E. E. Bowen has relinquished his commission on account of medical unfitness for Air Force service, retaining his rank.

W. T. Kenny to be Fl. Lieut. (Emergency).

Flying Officers T. L. Adamson, W. J. Bell, E. R. Bickerstaffe, G. R. Davys, H. T. Foot, J. H. Friend, D. V. Foster, N. Gillman, C. C. B. Guest, R. R. Hamilton, A. G. Hesling, G. Irvine-Robertson, J. C. Johnson, A. T. Macqueen, D. J. L. Macwatt, J. A. Morton, W. D. Munro, D. A. Stickland, and D. E. C. Whittome to be War Subs. Fl. Lieuts.

To be Flying Officers (Emergency): F. Batley, J. H. E. Bergin, J. W. Gibb J. A. Harrington, E H. Humphrey, P. R. N. Kerr, D. S. Smith, J. M. Whaites, P. Abbey, P. D. Bryant, S. C. Frazer, J. M. Herd, I. S. Hodgson-Jones, E. V. Hope, J. L. Insley, D. M. M. Jones, W. G. McEwen, R. Maggs, S. Rae, A. J. E. Rowe, A. Scott, R. Spielsinger, D. A. Tait, R. Whitelaw, and H. K. L. Young.

DIARY OF SOCIETIES AND LECTURES

Royal Society of Medicine.—*Mon.*, 4.30 p.m., Section of Odontology. *Tues.*, 4.30 p.m., Section of Medicine. *Thurs.*, 5 p.m., Section of Urology. Fri., 3 p m., Section of Epidemiology and State Medicine; 4.30 p.m., Section of Disease in Children.

Medical Society of London, 11, Chandos Street, W.—*Mon.*, 5 p.m., Discussion: Deferment of Senescence (Prophygeria). To be introduced by Mr. W. Sampson Handley.

Royal Institution, 21, Albemarle Street, W.—*Fri.*, 5 p.m., Prof. P. A. Buxton, F.R.S.: Natural History of Scrub Typhus.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. *for* 18 *words or less. Extra words* 3s. 6d. *for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.*

BIRTHS

Baxendine.—On March 26, 1945, at Elsie Inglis Memorial Hospital, to Peggy (*née* Houston), wife of Surg. Lieut. R. R. Baxendine, R.N.V.R. (Bombay), a son—Michael Richard.

Macfie.—On April 7, 1945, at the Winfield Nursing Home, Wokingham, Berks, to Thelma, wife of W. G. T. Macfie, M.B., Ch.B.—a daughter.

DEATH

Birdwood.—On April 14, 1945, very suddenly, at Walmer, Kent, Gordon Travers Birdwood, M.A., M.D. (Cantab.), B.Ch., D.P.H., Lieut.-Col., I.M.S. (ret.), aged 78.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY APRIL 28 1945

THE RIGHT OF APPEAL

BY
D. HARCOURT KITCHIN
Barrister-at-Law

This memorandum concerns the hypothetical right of a medical practitioner serving in a future "comprehensive" national health service to appeal to the High Court from any decision of the Minister of Health by which he may be aggrieved. This particular right of appeal must, however, for its better assessment and discussion, be surveyed against the right of appeal by other classes of persons against decisions of Government Departments or of similar bodies to whom Parliament has entrusted the power to make judicial or quasi-judicial decisions. Behind this wider question is the ever-changing balance of forces which we call the Constitution.

The Constitution

Medical men will agree that the student of the human body should not fix his attention unduly upon dissected portions of a cadaver, but should form as true an imaginative picture as possible of a normal living human being. Man performs his day-to-day functions and develops throughout his life by a ceaseless, complicated, ever-changing relationship of all his parts. So also the life of the body politic continually changes and develops, as now some, now others, of its organs gain preponderance. Three of these major political organs—the Legislature, the Executive, and the Judiciary—are especially important for the present inquiry.

In the fundamental scheme of our Constitution the Legislature makes the law, the Executive administers it, and the Judiciary interprets and enforces it. To put the matter in another way, our Constitution rests on the sovereignty of Parliament and the Rule of Law. Theoretically Parliament, consisting chiefly of the elected representatives of the people, can make any law; no man may be punished except for a definite breach of law proved in court; and every man is subject to the court's jurisdiction.

That is the present state of the constitutional relationship between Legislature, Executive, and Judiciary. These three authorities have not, however, sharply defined limits; there is and must be a considerable overlap. The pattern continually changes. Not historically long ago the King and his officers exercised arbitrary power over the lives, liberties, and property of his subjects. The pattern developed to curb his power; now it is becoming modified in another way, through an inexorable change that is taking place in the whole life of the country. This change is rapidly giving the Ministries, through the Cabinet, greater power as against Parliament, and also (through the form of the statutes which Parliament itself passes) greater power over the liberties of us citizens, with less control by the courts.

Judicial Powers of Ministries

No one has described this development more clearly than Prof. A. V. Dicey (1915). During the last eighty years, and notably since the beginning of this century, the nation as represented in Parliament has, he observes, undertaken to perform a large number of duties with which no English Government had formerly any concern whatever. When the Government shoulders new duties it must inevitably acquire more authority. This extension of its authority almost implies, and in fact has promoted, the transference to Departments of the Central Government of judicial or quasi-judicial functions.

Obviously it is highly convenient, he continues, when a Government Department is dealing with a matter in which large numbers of persons are interested, to leave it the power to decide more or less judicial questions. In other words, jurisdiction is almost inevitably given to a Department of Government, or to officials very closely connected with it.

The objections, he points out, are obvious. Such transference of authority from the courts saps the foundations of the Rule of Law. On the other hand, the servants of the Crown, if they are to manage business which was formerly carried on by each private citizen in his own interest, need that freedom of action which a private citizen necessarily possesses in the management of his own concerns. How, Dicey asks, could any trade prosper in the hands of a man who could not dismiss a clerk until he had obtained conclusive evidence of the clerk's fraud or misconduct, or if he could consider only what lawyers call the "best" evidence?

When jurisdiction is transferred by statute from a court to a Government Department, an observer may hold either of two opposite opinions. The one is that the Department should be obliged to conform to the rules of judicial procedure. The other is that this very transfer of jurisdiction from a court to a Department is *prima facie* evidence that Parliament intended the Department to exercise that jurisdiction in accordance, not with the rules which govern judicial procedure, but with the rules which govern the fair transaction of business by the Department. Much may be said in favour of each view, but the House of Lords, in the very important case of *Local Government Board* v. *Arlidge*, (1914) 1 K.B. 160, took the second view, which Dicey regards as in harmony with the legislative opinion that was already dominant in 1915, and which has certainly lost none of its strength in the last thirty years.

Their Lordships said that when a statute confers upon a Government Department judicial or quasi-judicial jurisdiction, and does not lay down any rule how this jurisdiction is to be exercised, the Department is not bound to adopt the rules of procedure which prevail in English courts. It must, however, act in the spirit of judicial fairness and equity. Dicey gives the opinion (which to-day may be regarded as a little optimistic!) that the English courts will probably always, in one form or another, find means of correcting any injustice in the exercise of judicial or quasi-judicial authority by a Government Department. Of course, if a statute did state how the jurisdiction was to be exercised, the rules in Arlidge's case would not apply. Statutes, however, very rarely, if ever, do so.

The Donoughmore Committee

This tendency of Parliament to give Government Departments judicial powers excluding the jurisdiction of the courts was already well established at the end of Victoria's reign. All the features of modern Acts of Parliament which Lord Hewart (1929) so strongly condemned were common practice a generation before his book appeared. Little was heard of them, however, until the first world war brought an immense expansion in legislation by Government Departments and in the powers of Ministers; and even so a whole decade passed since the Armistice before *The New Despotism* appeared, and, a few weeks earlier in 1929, the Lord Chancellor appointed a committee to consider Ministers' powers of legislation and judicial decision, and to suggest safeguards "to secure the constitutional principles of the sovereignty of Parliament and the supremacy of the Law." The committee, under the Earl of Donoughmore, consisted of some of the ablest Parliamentarians, lawyers, and civil servants of the day. It took evidence from every conceivable source that could possibly assist it; and its report (1932), together with the two bulky companion volumes of memoranda and evidence, completely exhausts the subject as that appeared thirteen years ago. Its findings on delegated legislation (Ministers' rule-making powers) are outside the scope of this inquiry, though not, it is submitted, outside the scope of the B.M.A. and the Negotiating Committee. Its findings on judicial or quasi-judicial decision by Ministers call for very keen attention whenever the form and powers of the new departmental tribunals are being discussed.

The Donoughmore Committee did not doubt that in the exercise of the judicial and quasi-judicial powers by Ministers justice was as a rule substantially done. Nevertheless, it said, justice is not enough; what the people want is security for justice, and the only security for justice is law, publicly administered.

Lord Hewart had used very emphatic language about this need. He had observed (*The New Despotism*, p. 48) that the Departments rarely published any reports of their proceedings or reasons for their decisions. As the proceedings, if any, were always held in secret, even interested parties could not learn what had happened or what the Department was likely to do in a future case. Neither of the parties concerned could believe he had had justice, and the policy was fatal to any confidence in the good faith of the tribunal.

The Donoughmore Committee regarded the whole of *The New Despotism* as a warning against real dangers, but saw no ground for public fear if the right precautions were taken; nor did it find in all the evidence which it had heard any reflection on the sense of justice of the Civil Service.

Independent Special Tribunals

Certain special tribunals are appointed by Ministers of the Crown or on their recommendation, but are nevertheless quite independent of the Minister who appoints them, and act as regular courts of law with a special jurisdiction. An example is the Railway and Canal Commission, composed of a judge and two commissioners. The Chief Registrar of Friendly Societies is a barrister appointed by the Treasury who arbitrates in disputes and investigates the affairs of societies; as Industrial Insurance Commissioner he also deals with industrial disputes. The Special Commissioners of Income Tax are appointed by the Treasury to settle income tax. Although they are all civil servants, their impartiality is unquestioned and they have the complete confidence of the public. The Board of Referees for income-tax questions, also appointed by the Treasury, consists of specially qualified business and professional men with a King's Counsel for chairman. Appeals lie from the decisions of all these tribunals to the High Court.

Departmental Tribunals

Many other tribunals are created by statute to work within a Department for the express purpose of determining questions which ought to be treated judicially. Under the Unemployment Insurance Act, 1934, a person claiming benefit applies to the insurance officer; claims which he will not allow go to the Court of Referees (representing employers and insured contributors), and appeals from this court go to an umpire appointed by the King. Under the War Pensions Act, 1921, a dissatisfied person appeals to a Pension Appeals Tribunal appointed by the Lord Chancellor, the decision of which is final. The current emergency legislation gives an appeal from pensions appeal tribunals to the Minister, whose decision is final. Under the Widows', Orphans' and Old Age Contributory Pensions Act, 1925, a person dissatisfied by a decision of the Minister may appeal to a referee chosen from a panel of lawyers appointed by the National Health Insurance Joint Committee. No officer of the Department may be a member, and the decision of the referee is final, except that he may state a case for the court on a point of law.

When the Minister determines whether a given employment comes under the N.H.I. Acts, a member of his legal staff hears the case, the Minister gives his decision, and an appeal on a point of law lies to a judge of the High Court. If a question arises whether a given school is necessary or not, the Board of Education may appoint a person or persons to hold a public inquiry; the report is available to any local education authority or person interested, but there is no appeal from the Board's decision.

Judicial and Quasi-judicial Decisions

The committee defined and distinguished between judicial and quasi-judicial decisions. A true *judicial decision*, it said, presupposes an existing dispute between two or more parties, and requires four things: (1) The presentation of their case by the parties. (2) The ascertainment of the facts by evidence adduced by the parties, often assisted by argument. (3) Legal argument (if law is in question). (4) A formal decision, finding the facts and applying to them the law of the land.

A *quasi-judicial decision* similarly presupposes the dispute and requires the presentation of the case and the ascertainment of the facts. It does not, however, involve legal argument, nor does it include a final judgment. This is replaced by administrative action. Where a Minister has absolute discretion to take action if certain facts are proved, his ultimate decision is *quasi-judicial*, because it is governed, not by a statutory direction to him to apply the law of the land to the facts and act accordingly, but by a statutory permission to use his discretion after he has ascertained the facts, and to be guided by public policy.

Purely *judicial decisions* are not often entrusted to Ministers by statute. An example, however, is found in the National Health Insurance Act, 1936, which obliges the Minister to determine whether persons in any given class of employment are insurable under the Act. If a hearing is necessary, the Minister appoints one of the barristers or solicitors of the Ministry to hear the persons interested and report. Public notice is given, and counsel may appear. The Minister's decision is declared to the parties by memorandum, but he is not expressly obliged to give reasons. An aggrieved party may appeal, on a question of *law* only, to a judge of the High Court selected by the Lord Chancellor; the Minister may appear and be heard.

An example of a *quasi-judicial decision*, on the other hand, may be found in the provision of the Housing and Town Planning Acts that the medical officer of health of a district must give to the medical officer of health of the county any information which he is able to give, and which the county M.O.H. may reasonably require for the purpose of his prescribed duties. Any dispute between two medical officers is referred to the Minister, whose decision is final and binding. The Minister must give both officers a chance to present their case; he must find out the facts by means of evidence brought by the parties; but then he must decide whether the requirements of the county M.O.H. are reasonable. For this decision he must consider medical policy in local administration: he must decide what is best to do, and do it.

Natural Justice

The Donoughmore Committee agreed that even in a quasi-judicial decision the Minister ought not to depart from or offend "natural justice." This concept is not bounded by any definite rules recognized and enforced by courts of law, but the committee had no doubt that all tribunals and persons who give judicial or quasi-judicial decisions ought to obey certain canons of judicial conduct which are implicit in the Rule of Law. These are:

1. A man may not be judge in his own cause.
2. Each party must be heard (though not necessarily orally), and must know in advance the case he has to meet.
3. A party is entitled to know the reason for the decision.

The committee was inclined to add a fourth canon, though it admitted that its validity had been denied by some judges: that where an inspector holds a public inquiry, his report should be available to the parties.

Constitutional Rights of Appeal

Theoretically, even if an Act of Parliament makes the Minister's decision final and gives an aggrieved person no right of appeal to the High Court, he may nevertheless appeal successfully if he can show that the Minister, in reaching his decision, exceeded his powers, or offended against the rules of natural justice, or had no evidence on which he could find as he did. In practice this remedy has little value. The aggrieved person applies to the King's Bench Divisional Court to grant him one of the prerogative writs—certiorari, mandamus, or prohibition. The process is far too cumbersome and expensive for most litigants; its success is very uncertain; and the reticence of Departments concerning their proceedings often makes proof difficult or impossible. Nevertheless, its existence doubtless has a steadying effect upon departmental officers.

Far more significant from a practical point of view is the opportunity which an aggrieved person has of persuading his Member of Parliament to draw public attention to his grievance by asking a question in the House of Commons, or a Peer to raise it in the House of Lords by a motion for papers. This action generally ensures at least that the responsible Minister shall properly investigate the complaint; and the ever-present possibility of a question is a healthy deterrent to civil servants against arbitrary and unjust decisions. Nevertheless it is obviously not an adequate substitute for a complete review by a court of law.

Disciplinary Action—Judicial or Quasi-judicial?

The question obviously arises here whether the decision of the Minister on an appeal to him by or against a medical practitioner under the N.H.I. Acts is judicial or quasi-judicial. Clearly it is in form quasi-judicial, for, though it involves the presentation of their case by both parties to the tribunal, and the ascertainment of fact by means of evidence adduced by them, and even though the president of the appellate tribunal is a lawyer, yet the Minister has absolute and final discretion to dispose of the appeal. The law of the land concerns him hardly at all; and however anxious he may be to approach the matter judicially, questions of departmental policy must often closely concern him. In deciding a similar appeal under a new "comprehensive" service they will doubtless concern him more constantly and closely still.

The position of insurance practitioners in relation to Ministerial decisions seems to be unique. The Statute Book does not seem to contain another instance of the employment under contract of many members of one profession, with disciplinary machinery whereby they may be deprived in certain circumstances of some of their agreed remuneration. Without doubt similar machinery, or machinery having a similar purpose, will form part of the Act establishing the new National Health Service. A decision, under either the existing N.H.I. Acts or the new Act, resulting in the imposition of a fine on an insurance practitioner or his ejection from the service seems to have little, if any, really administrative element in it, and to be indistinguishable from judicial proceedings in which no point of law or question of policy is involved, and the result of which is to establish whether the terms of a contract have been broken or a criminal offence has been committed.

Members of the B.M.A. may think that such decisions are essentially judicial and ought so to be treated under any new legislation. Doubtless their present quasi-judicial treatment is the real cause of discontent and of the demand for an appeal.

Appeals by Insurance Practitioners

The machinery for hearing and determining complaints against insurance practitioners under the N.H.I. Acts is set up, not by the Acts, but by regulations made by the Minister under them. Complaints are heard by the local medical service subcommittee; appeals by doctors are heard by a board of three, one of whom is medical. If the Minister punishes a doctor who has not yet appealed, the doctor may appeal to a tribunal consisting of officers of the Department and a doctor from the Advisory Panel of the Insurance Acts Committee of the B.M.A. Charges of negligence must be referred to the Minister's Advisory Committee, which consists of three medical officers of the Ministry and three members chosen from the I.A.C. panel. If a local committee recommends that a doctor's name shall be removed from the medical list, the Minister must appoint a committee of inquiry consisting of a lawyer and two doctors, one of whom is on the I.A.C. panel; this committee's report is referred to the Advisory Committee. Beyond the Minister there is no appeal to the High Court.

Future Disciplinary Machinery

The Association must in due course consider the form of the disciplinary machinery in the projected National Health Service, and whether the Negotiating Committee should press for a right of appeal to the High Court, or even for an initial hearing of complaints before a judge.

On the other hand, the present fact-finding machinery is so constituted as to be strictly impartial and to give ample representation to the medical profession. The procedure seems to be strictly judicial in its form. The Negotiating Committee would not easily maintain that an ordinary court of law was better equipped to find the facts in an inquiry of this class, which involves so many questions of medical practice and insurance procedure. Nor would a case for an appeal to the High Court on questions of fact be much easier to establish. High Court judges have never shown any great inclination to review the findings of fact of a properly constituted tribunal which has acted in accordance with natural justice. The Donoughmore Committee was satisfied that no appeal to a court of law from a departmental tribunal should as a rule be allowed on any question of fact.

On the other hand, Parliament has recently tended, when establishing new domestic tribunals within a profession which has been granted State recognition, to give an aggrieved person a right of appeal to the High Court on both law and fact. Dentists, nurses, midwives, architects, solicitors, pharmacists, and others can all move the High Court to review in detail adverse decisions of their domestic tribunals. The medical profession is probably unique in not possessing this appeal from the General Medical Council. No general demand is expressed by doctors for such an appeal, and I should be very surprised to learn that the G.M.C. itself thought an appeal necessary, or would support the insertion of one in the next Medical Act.

An appeal on fact from the decision of the Minister on an insurance complaint may, however, be considered more necessary. Unlike a penal erasure by the G.M.C., removal from the N.H.I. *Medical List* is an absolute prohibition of practice, and is not imposed by a purely domestic tribunal. The Association may think, however, that the proposal for an appeal to the High Court on fact would not be likely to find acceptance either by the Minister or by Parliament, and that the interests of insurance practitioners under a future scheme would be better safeguarded in other ways. In the exceptional case where an appeal on fact may be allowed, it should, in the opinion of the Donoughmore Committee, go to an appeal tribunal constituted by the Lord Chancellor and consisting of three persons, one of whom should be legally qualified and preside.

In demanding an appeal from a judicial decision of the Minister or a tribunal on a point of *law*, the medical profession would have the support of the Donoughmore Committee, which saw no justification for sheltering Ministers or their tribunals from the courts of law where their jurisdiction involved judicial decisions. Such immunity, it said, is contrary to the constitutional principle underlying the Rule of Law. Moreover, the new scheme is likely to produce a good many doubtful points of law in its early years. The committee felt strongly that a uniform and simple procedure should be established for all such appeals. In general, it advised that the time within which appeals might be brought should be strictly limited; that they should be determined in a summary manner; that the appeal should be to a single judge of the High Court, perhaps a particular judge appointed for cases of the kind; and that the decision of the High Court should be final, though it might give leave to appeal further on a legal question of unusual importance.

Safeguards under the New Act

The report of the Donoughmore Committee suggests a number of safeguards against the abuse of Ministerial discretion which might perhaps be applied to the new service. In advocating them the Association could pray in aid the great authority of the report. On the other hand, during the thirteen years, five of them war years, which have passed since the report was published, the shadow of the Executive has grown great and that of the courts has sensibly declined.

The operation of the new service is likely to raise many questions of law as well as of practice, and the statute should therefore provide for an appeal by an aggrieved doctor to the High Court at least on questions of law, doubtless by the familiar procedure of "case stated." A simplified form of procedure by which the High Court could be moved to interfere if the Minister exceeded his powers or infringed the rules of natural justice would be highly desirable, but such a reform is outside the scope of this legislation.

One aspect of "natural justice" may, however, be considered more closely. The Donoughmore Committee, in pointing out that a man should not be a judge in his own cause, expressed the strong opinion that bias from strong and sincere conviction as to public policy may be a more serious disqualification than pecuniary interest. Hence, whenever the Minister's Department would naturally desire that the decision should go one way rather than another, the Minister should be regarded as having an interest in the cause. In such a case Parliament ought to provide that the question should be decided, not by the Minister, but by an independent tribunal.

Possibly the Minister and his advisory tribunals have no particular interest to-day in the outcome of any appeal by an N.H.I. doctor. In the new National Health Service, however, novel motives may become dominant. The cost of the new service will probably be a constant and serious source of anxiety to those responsible for administering it. If a policy of strict economy should be forced on the Ministry, then its officials will have a strong interest in the outcome of every complaint against a doctor for ordering unnecessary treatment. It is not fantastic to fear that disciplinary action against doctors whose zeal involves extra expense may become linked with the policy of the Department. The possibility of such a bias may justify the creation of a disciplinary tribunal independent of the Department, with an appeal perhaps to an umpire, perhaps to a special appellate body, perhaps to a judge of a High Court, rather than to the Minister.

The committee recommended that where certain judicial issues arising out of the administrative work of a Department are not suitable for decision by the ordinary courts, and there is no exceptional reason for giving them for the Minister to decide, Parliament should provide for their reference to an independent tribunal outside the Department. If many cases of the same kind are likely to arise, it might be better to constitute a permanent special tribunal. The tribunal's decisions should be independent of the Minister, but the committee saw no reason why the Minister should not appoint it.

Reasons for a Decision

The Donoughmore Committee were quite clear in their minds that in natural justice a party is entitled to know the reason for even a quasi-judicial decision, even when that decision is final and there is no appeal. When an appeal is possible, the case is even stronger, for it is contrary to natural justice that the silence of the Minister or tribunal should deprive a disappointed party of the possibility of succeeding in an appeal. Moreover, from the angle of broad political expediency the committee saw a real advantage in communicating the ground of a decision to the parties concerned and, if of general interest, to the public.

Where the question at issue is simply whether the doctor committed or did not commit certain offences, and where the only reason for the Minister's decision is that he believes the evidence of the complainant and disbelieves that of the doctor, the need for a statement of the reason for his decision may not be very great. The General Medical Council never gives the reasons for its finding of guilty or not guilty, and no member of the profession, so far as I know, has ever suggested that it should. Where, however, the amount of a fine is in issue, and especially if proceedings under the new Act raise novel points, the respondent practitioner may in justice be entitled to a reason. The Negotiating Committee could therefore make a fair case for requesting that the statute should require the Minister, at the request of an aggrieved person, to give reasons for his decision.

The fullest information compatible with the public interest should be given, in the form of a reasoned document available to the parties, stating the findings of fact and the determination of any points of law. The Donoughmore Committee also commended the practice of publishing leading cases for general guidance; but such a practice could hardly be enjoined by statute, for it is one over which the Minister would have to be given complete discretion.

Reports on Public Inquiries

The Donoughmore Committee summarized the arguments for and against the publication of reports submitted to the Minister by inspectors who have held public local inquiries—e.g., into the merits of a projected scheme or the working of an approved one. This question is probably outside the scope of this memorandum, but it is bound to come into prominence sooner or later, because very many schemes will be made under the new Act and many quasi-judicial decisions affecting doctors and voluntary hospitals will be given after inspectors have reported. I therefore venture to call attention to this matter in passing.

Points from the 1944 A.R.M. Agenda

In conclusion, one or two points in the Notices of Motion for the A.R.M. Agenda, 1944, perhaps call for comment. In No. 202, Gateshead suggests an appeal to the General Medical Council or some similarly constituted body. Perhaps if Gateshead had considered rather more closely how the G.M.C. is really constituted, it would have found that assembly less attractive as an appellate tribunal. The chief aim underlying the constitution of the G.M.C. is to provide representation for each of the licensing bodies. A tribunal consisting of 39 senior medical men, most of them distinguished chiefly by academic attainment, is not outstandingly well suited to determine appeals by doctors against decisions of a departmental tribunal. Nor does its constitution invite imitation when a new appellate tribunal is being formed.

On Motion No. 204 it is hard to see how a national health service could possibly be instituted unless it added something to the doctor's common-law rights and duties. After all, the State must be a party to the contract, and can only become one by virtue of a statute imposed on the common law.

Summary

The exercise by the Minister of Health of judicial or quasi-judicial powers is an inevitable product of modern methods of government. In doing so he need not conform to the methods of the courts, though he must act in fairness and equity. In practice he does so act. His decisions in medical disciplinary cases are, however, in form, quasi-judicial and administrative, and this fact is probably the root cause of the discontent which expresses itself in the demand for an appeal to the High Court.

Such an appeal is already available by prerogative writ on the general ground that the Minister has exceeded his powers or offended against natural justice, but procedure is cumbrous, expensive, and uncertain, and its scope is narrowly limited. The remedy of a question in either House of Parliament should not be undervalued.

The Negotiating Committee might hope to persuade the Government representatives to agree to an appeal to the High Court from the Minister's decisions on points of law. Such a right might be valuable in the early years of the novel and complicated scheme that is projected. The committee would have far less hope of obtaining an appeal on fact. Lawyers, administrators, and legislators are fairly generally agreed that, particularly where the issues are technical and domestic, a special tribunal is far better able to ascertain fact than is the appellate court. The Donoughmore Committee advised against allowing such appeals, even against purely judicial decisions.

On the other hand, in hearing an appeal against adverse decisions by the domestic tribunals of the dental, nursing, solicitors', and other professions, the High Court will review the findings of fact, and there is some ground for regarding the disciplinary tribunals in a national medical scheme as domestic tribunals—the more so as, almost or quite alone in the whole range of Ministerial tribunals, they will hear charges akin to crime, breach of contract, or tort, and impose penalties akin to fine. On balance, the Association may think that its legitimate aims could be better pursued by pressing for the creation of independent special tribunals to hear appeals, or even complaints at first instance. The statute should oblige the Minister to give full reasons for his decisions, and his Department should cultivate the practice of publishing leading cases as a guide to its policy and requirements.

A NATIONAL HEALTH SERVICE

UNIFICATION OF ADMINISTRATION

BY

GEORGE F. BUCHAN, M.D., F.R.C.P., D.P.H.

1. The medical profession has asked that the Minister of Health should be responsible for all the civilian health and medical functions of central government, including those now the functions of other Ministers. The reason for this request is that there is no one Ministry which serves as a link between the Government and local authorities, and still less any Ministry which links up the health and medical work of the several Government Departments.

2. Let it be said at once that the Ministry of Health is probably the Ministry to which most of the correspondence of local authorities goes, but the latter are also in direct communication with the Ministries of Education, Reconstruction, Labour and National Service, Home Security, Works, Fuel and Power, Town and Country Planning, Supply, Agriculture and Fisheries, Food, and will be no doubt in the future with the new Ministry of Social Insurance.

3. So far as health is concerned the Ministry of Health, the Ministry of Education, the Home Office (most of whose functions have been handed over to the Ministry of Labour and National Service), the Ministry of Fuel and Power, and the Ministry of Supply have each a separate health service, and it may be that the Ministry of National Insurance will in its turn set up its own medical staff.

4. There is little, if any, correlation between these various medical staffs, except that the Chief Medical Officer of the Ministry of Health is also the Chief Medical Officer of the Board of Education; but he serves two masters—namely, the Minister of Health and the Minister of Education. This differs from the local arrangement where the medical officer of health is the school medical officer, because in this case the medical officer of health serves only one master—namely, the local authority, which is also the local education authority.

5. The medical profession is well aware that water supplies and housing, with which the Ministry of Health deals, have their health aspects, and indeed the profession has strongly advocated the importance of environmental conditions in any national health service, but it considers that a central Government Department dealing with health should confine itself to these health aspects and not concern itself with the building of houses, which would appear to be a more suitable job for the Ministry of Works or some such Ministry. In any case, whatever additional functions the Ministry of Health may see fit to take unto itself, the medical profession is agreed that all the medical and health functions of the various Government Departments should be brought within one central Health Ministry.

6. In putting forward this request the medical profession realizes the essential unity of medicine and that health cannot be dealt with in separate compartments—at the home, in the school, in the factory, in the office, or on land or at sea. It is alive to the fact that many circumstances must be taken into account in the maintenance of well-being, and that knowledge acquired in connexion with one group may be found of exceeding value in the elucidation of problems arising in another. The White Paper itself makes a somewhat similar statement. It states on page 6: "The first-line care of health for everyone requires a personal doctor or a family doctor, a general medical practitioner available for consultation on all problems of health and sickness," and again on pages 7 and 8:

> "Many services are also rendered by local authorities and others in special clinics and similar organizations, designed for particular groups of the population or for particular kinds of ailment or medical care. These are, for the most part, thoroughly good in themselves, and they are used with advantage by a great many people in a great many districts. But, owing to the way in which they have grown up piecemeal at different stages of history and under different statutory powers, they are usually conducted as quite separate and independent services. There is no sufficient link either between these services themselves or between them and general medical practice and the hospitals.
>
> In short, general medical practice, consultant and specialist opinion, hospital treatment, clinic services for particular purposes, home nursing, midwifery *and all other*

> *branches of health care* [my italics] need to be related to one another and treated as many aspects of the care of one person's health. That means that there has to be somewhere a new responsibility to relate them if a service for health is to be given in future which will be not only comprehensive and reliable but also easy to obtain. . . . These are some of the chief deficiencies in the present arrangements which, in the view of the Government, a comprehensive health service should seek to make good."

On page 37 of the White Paper the first sentence in the last paragraph reads:

> "The aim of the service will be to provide every person, or better still every family, with a personal or family practitioner who will be able to become familiar with the circumstances of those in his care—in the home and at work."

7. Other statements in the White Paper, however, confuse this matter. The last sentence of the first paragraph on page 10, under the appropriate title "Some Misconceptions about the Meaning of 'Comprehensive,'" reads:

> "There are many specialized and separate forms of undertaking—such as the supervision of industrial conditions—which may affect health and which may require the medical expert as much as they require the engineering or the legal or any other expert, but which cannot, simply for that reason, be regarded as necessarily part of the personal health service."

The second paragraph on the same page goes on to suggest that the doctor who is responsible for the care and health of the individual has only to take into account the home as it affects health. The White Paper—again page 10—also states that "very similar considerations" apply to the school medical service, and apparently regards the family doctor as not concerned with the school life of the child, but merely as providing such forms of treatment as may be needed by the children.

8. This confusion of thought in the White Paper is made the more bewildering by the first sentence of the last paragraph on page 10, which states:

> "The proper continuance of environmental and preventive services in school and industry may well be coupled with the habit of using for those services doctors who are also engaged in the personal health service—so that there is a continuous blending of experience in both kinds of work."

9. In the report of the Social and Preventive Medicine Committee on Industrial Medicine, issued by the Royal College of Physicians of London, the position is clearly stated in the following paragraph appearing at the top of page 15:

> "The reasons which led the committee to adopt these views* on organization are briefly as follows: (i) the health of the individual at home and at work cannot rationally be separated; (ii) it would be impossible to secure efficient rehabilitation unless there were the closest link between the two services; (iii) the development of the national health service on sound lines requires direct access to the wealth of knowledge accruing from observations of health in industry; and (iv) the new industrial health service must spread its influence far and wide into work which is much more closely associated with home and family than the factory."

10. In Appendix A (p. 66) relating to industrial medical services the White Paper states that the works doctors under the Factory Acts, the medical service of the Ministry of Supply, and the medical staff of the Ministry of Fuel and Power give a certain amount of useful personal medical advice to the employee on the spot. It will therefore be seen that in the White Paper the Government recognizes, in both theory and practice, that the various health services cannot well be separated, and this is the advice also tendered by the medical profession. So far as I am aware no good reasons have been given against the acceptance of the proposal. It is a reform which could be operated by administrative action almost at once, and the rejection of professional advice at this stage, without adequate reasons, is not too happy an augury for the future.

11. The great mass of the medical profession is resolved that this unification of all health and medical services is fundamental to the establishment of a comprehensive health service, and, moreover, is essential if doctors within the service are to be able to study all possible causes of personal ill-health, and so to work for the improvement of national health. In all these circumstances it is sincerely to be hoped that the Negotiating Committee will be able to secure acceptance of this proposal by the Government, for it is in the interest of the public that the medical profession should have the best opportunities to serve.

---

* ("The industrial health service should be an integral part of the proposed national health service and should be administered centrally by the Ministry of Health.")

HEARD AT HEADQUARTERS

The New Education Act

It was unfortunate that the Minister of Education, when asked to receive a deputation from the B.M.A. concerning the school medical service under the new Education Act, found himself, owing to his many appointments, unable to do so. But on receiving the Secretary's letter, published last week (April 21, p. 60), he has now found it possible to receive a deputation.

Sir John Boyd Orr, M.P.

The return of Sir John Boyd Orr to Parliament as one of the members for the Scottish Universities is a very satisfactory event. Sir John is a conspicuous addition to the comparatively few members of the House of Commons who can speak authoritatively on scientific subjects. His work in the field of nutritional research as director of the Rowett Institute and as lecturer at Aberdeen University has gained him widespread renown. Lately Sir John has become chairman of the B.M.A. Committee which is working out a charter for health—in other words, preparing a statement of the present provisions and future needs concerning housing, nutrition, and like matters. The report of that committee when it appears will signify the strong feeling of the profession that the solution of health needs is not to be found in more doctoring, but in adequate nutrition and housing in particular, as well as in the provision or social security generally. The Association was fortunate in inducing Sir John Orr to lead the work of that committee, and in Parliament he will find a new sphere of usefulness.

South African Parallel

The medical profession in South Africa is facing a situation not unlike that which confronts their colleagues in this country over the White Paper. A National Health Services Commission which was set up by the Government has lately reported, and apparently its recommendations have proved very satisfactory to the profession. One recommendation specially welcome is the provision that at all levels, right up from the local health centres, through the regional bodies, to a National Health Council, which is concerned with national policy, there should be adequate representation of the profession. There are independent advisory bodies at all stages. One feature of the South African proposals is the setting up of a National Health Congress, presumably to be held annually or as occasion requires, in which all those working in the new health services will be able to come together and express their views on professional, technical, and scientific matters, and on service conditions.

Speech Therapists

One of the smaller of the recognized qualifying bodies under the scheme for the registration of medical auxiliaries—namely, the College of Speech Therapists—recently held in London its first conference, and what it lacked in numbers—for there are only some 200 qualified speech therapists in practice—it made up in enthusiasm and expectation. It was addressed by Mr. Zachary Cope, president of the Board of Registration of Medical Auxiliaries, who commented on the fact that at present there is no professor or lecturer in speech therapy at any university, that many major education authorities do not as yet recognize the subject, and that only a relatively few hospitals have a speech therapist attached to them. A doubling of numbers of speech therapists was called for. Mr. Cope spoke of the great appreciation felt for the work of medical auxiliaries, not only by the medical profession but also by the Ministry of Health—an appreciation which has been growing during the last fifty years, and especially during the last ten, since the Board of Registration was founded.

Doctors and Population

The report of the National Health Survey in Canada is an elaborate document—a sort of census of medical production. Only one point can be dealt with here—the number of doctors in Canada to the population. For the whole of Canada, in 1943, there was one active civilian physician for every 1,261 inhabitants. The best-doctored province (so far as numbers go) is Ontario, with one physician to 1,068 population, and at the other extreme is New Brunswick, with one to 2,136.

The term "physician," of course, includes every type of medical practice. If we take general practitioners only we find that of the 8,614 physicians who were in active civilian practice in Canada in 1943, the general practitioners accounted for 5,894, or 68.4%. The number of general practitioners in proportion to the population for the Dominion as a whole was one to 1,843, and once again Ontario was first with one to 1,520, and New Brunswick last with one to 2,877.

Comparisons are not only odious but misleading. Roughly, however, it may be said that in England and Wales in 1943 the ratio of general practitioners to population was one to 2,786; about the same as New Brunswick's; and even before the war the figure was nothing like that of Ontario; it was one to 2,184.

Protest in Verse

Poetry does not often intrude itself into the discussions of the Public Health Committee of the B.M.A., but one of its members at the last meeting, in declaring his antagonism to a certain proposal, asked permission to voice his protest in eight lines of verse, and then did so. The matter before the meeting was a memorandum by the Royal College of Physicians, the B.M.A. Group of Practitioners of Psychological Medicine, and the Royal Medico-Psychological Association on the future of psychiatric services. While the memorandum was regarded as an excellent piece of work, exception was taken to one recommendation—namely, that as an important prophylactic measure there should be systematic psychological examinations of every school-child, these examinations to be primarily the function of the educational psychologist.

One member said that this was not the right approach, and that all children ought to be regarded as normal until it appeared—as would happen ordinarily upon the representations of the teacher—that a given child was abnormal. The member who dropped into verse on the subject quoted the lines of Francis Brett Young, beginning:

> " Is there no doctor, then, for the sick soul,
> Only too many sedulous to trace
> The springs of decadence in a dying race?"

The verse goes on to speak of " charlatans whose prurient fingers probe beneath the veil of consciousness." It was a little reminiscent of the old days, sixteen years ago, on the B.M.A. Committee on Psycho-analysis, when weird revelations were made by some of those who gave evidence.

Diseases cost Sweden and her six and a half million inhabitants about 600,000,000 kronor (£35,300,000) a year in direct expenditure alone, and the indirect expenses through losses in working hours and productive capacity are estimated at 1,000 million kronor (£58,800,000). These figures are given in a recent survey in the *Swedish Medical Journal*, based on investigations carried out by Dr. Sven Rydenfelt of Lund University. The dates refer to 1940 and 1941, the last years for which complete statistics are available. Out of the 600 million kronor about 400 millions are budgetary expenditure on the part of the State in the form of costs for public health and the care of the sick, subsidies to sick benefit funds, invalidity relief, etc. About 200 millions may be regarded as social-economic expenditure disbursed by the citizens—e.g., for dental and medical treatment, medicine, payments to sick benefit funds, etc. The figure for losses in productive capacity—i.e., 1,000 million kronor—has been arrived at by calculating 400,000 lost working years and an annual income of 2,500 kronor. This must be regarded as a minimum, the survey points out, and the losses are probably still higher. It may be mentioned in this connexion that the Swedish Government has in recent years appropriated considerably increased sums for public health and the care of the sick with a view to rendering more effective the fight against disease. A nation-wide health campaign under the slogan " A Healthier People " has also been started this spring, in which some s will teach the Swedish people by d demonstrations the principles of lth.

SIR,—I have consistently opposed insurance for personal medical attendance being made compulsory for the whole population because I believe that this will endanger the freedom of the medical profession and the continuance of independent practice. It is a fundamental right of a free people that they should be able to obtain independent professional advice and help. This can only remain available if the professions retain their freedom, and independent practice continues. Independent practice is a large factor in ensuring the freedom of a profession, for it makes certain that a number of practitioners remain at liberty to state their views freely and publicly and without regard to departmental approval or disapproval. They also remain free to give independent advice without regard to any other considerations than the patient's interests.

If insurance for personal medical attendance were made compulsory only for the present insured classes and their dependants, while others were given the option to insure instead of only the option not to use the service, the continuance of independent practice would be assured. It would also be known how many persons wished to be included in the scheme. This would simplify the problem of deciding on the remuneration of insurance practitioners, with fairness on the one side to the insurance fund and the Exchequer and on the other side to the doctors and contributors. It is surely more reasonable to allow those outside the present insured categories the option of insuring than to give them the option of not claiming benefit, and making independent arrangements when needing medical attention.

Insurance for personal medical attendance is different from all other measures of social insurance and cannot be compared with institutional treatment, disability and unemployment pay, children's allowances, maternity benefit, old age pensions, burial allowances, or other social benefits. Social insurance contributions must necessarily differ for different categories of the community, and it is consistent with such variations for insurance for a general practitioner service not to be compulsory for all.

It should always be borne in mind that ultimately it will be for members of the medical profession to decide whether they are willing to enter into contracts carrying the liability to attend any member of the community on a capitation basis whatever his financial position. It has still to be ascertained whether the number of doctors prepared to enter into such contracts will be sufficient to enable the Government to provide a universal service for which they at present propose to levy contributions.

Another danger of making insurance for personal medical attendance universal in its application is that it may eventually steer us towards a whole-time salaried service. The original scheme of the Ministry of Health was such a whole-time service, and, in the course of a human generation, it would have destroyed the freedom of the profession and converted it into a public service. That scheme was rejected by the profession and was discarded, but the same result may be achieved by other means, and there are signs of such tendencies in the plans outlined in the White Paper. It is not surprising, therefore, that there is uneasiness lest this is still the goal aimed at. That uneasiness is increased when Socialists make it perfectly plain that it is definitely their objective.

Another important point is to link the general practitioner service with the insurance contributions. The hospital services should be maintained out of rates, taxes, and voluntary contributions and be open to all. The general practitioner service, which would be open to contributors, should be maintained almost entirely out of insurance contributions. Thus the doctor–patient relationship would not be disturbed and voluntary contributions to hospitals would not be discouraged by every insured person being told that he had already contributed directly to their maintenance.—I am, etc.,

London, W.1. ALFRED WEBB-JOHNSON.

Public Pronouncements

SIR,—At a meeting of the Socialist Medical Association, held at the Caxton Hall on March 15, Dr. Somerville Hastings is reported to have said: "To extend the 'panel,' as is proposed, means the continuance of two sorts of patients —the private, who enters by the front door and is seen at once, and public, which comes in at the back and has to wait long periods—and two sorts of treatment as well" (*Yorkshire Post*, April 16).

I should like to ask on what grounds Dr. Hastings makes this statement, which shows such a deplorably low opinion of his professional colleagues. After many years in practice I have no knowledge, except isolated instances, of the practices mentioned, and I believe the body of panel doctors to be honourable men who are anxious to serve their patients and would never descend to such methods.

Dr. Somerville Hastings is president of the Socialist Medical Association and his speech will be widely read. It is unfortunate, likely to mislead the public, and to unfairly discredit the panel service.

My attention was recently arrested by a speech of another high officer of the Socialist Medical Association—Dr. Stark Murray, vice-president. Speaking at a public debate in Sheffield he is reported to have said: "The politicians in the B.M.A. wanted the Advisory Council to be elected by the doctors because they wished to use it as a political weapon" (*Sheffield Telegraph*, Jan. 29).

I gathered, in listening to Dr. Stark Murray's speech, that he himself is no mean politician, and probably is a better judge of that class than I, but again is it not deplorable that doctors in prominent positions should hold such a low opinion of their professional brethren? Dr. Murray's statement was made in replying to the debate, when no further comment could be made.

Men of scientific training have a special responsibility in maintaining a high standard of controversy, which is possible even in political warfare.—I am, etc.,

Sheffield. HENRY BROWN.

Medical Demobilization

SIR,—We should be grateful for information whether demobilization of medical personnel is to march in step with demobilization of the executive branches. This would appear on the surface not to be the case, as medical officers of the earliest demobilization groups are still being sent out to this command. Should any such selective demobilization be under consideration, as is most strongly suggested on this evidence, then the so-called demobilization scheme would be a mockery and give rise to much discontent.

While it is appreciated that the Services will not wish to lose their more senior and more experienced reserve medical officers, there appears to be no reason why a system of mutual exchange with E.M.S. personnel of a similar professional standing should not be put into operation.

It may be argued by the Services on behalf of the retention of senior M.O.s that the introduction of new personnel at this stage of the war would be detrimental to the efficiency of the Service. This argument obviously can hold no water professionally. It is equally obvious to most of us that Service routine is far less of a mystery than it is sometimes claimed to be, and it can be picked up quite quickly.

With the defeat of Germany in the not too distant future, we feel that, like us, the attention of many long-service M.O.s is being drawn to the suggested scheme of demobilization by groups. We consider that it is high time a definite announcement was made to serving M.O.s about the likelihood or otherwise of a return to civilian life, on a par with the return of other members of the Forces. A statement that one's chances of demobilization will depend upon "the exigencies of the Service" is, we consider, a vague, utterly ill-defined term, and is redolent of one of those all too common bits of Service jargon which are completely meaningless.

We feel certain that no serving M.O. will be satisfied with this equivocal answer; and the advent of high-priority M.O.s on this station suggests that the medical personnel of the Services are not to be represented on the age and length of service scheme for demobilization.—We are, etc.,

S.E.A.C. "TWO NAVAL DOCTORS."

Homoeopathic Medicine Group

SIR,—What a really charming thought it is that the homoeopaths should have their own Group for the better discussion of their—"specialty" I think was the word. Tolerance is everything, and scientific medicine should not be so narrow-minded as to exclude those who live by faith alone. But must it remain there? Cannot the osteopaths have a group, too, and the chiropractors, if any happen to be members of the B.M.A.? And there must be a few modest naturopaths here and there, too shy to ask themselves. Will no one speak for them?—I am, etc.,

Ashtead, Surrey. W. EDWARDS.

War Gratuities

SIR,—Many of your correspondents deplore at length the proposed financial awards to officers of the R.A.M.C. on demobilization and compare their lot unfavourably with that of civilian medical practitioners. They speak also of the "professional suicide" of their lives as serving officers. I should like to point out that, at any rate in the case of those who joined the Army in 1939, ours was a voluntary enlistment. If some doctors preferred to forgo, or were otherwise debarred from, enjoying the privilege of serving their country, the loss is theirs and ours the greater honour. That should suffice for most people.

With regard to the phrase "professional suicide," I would like to point out that I have been successively a regimental M.O., a prisoner of war, and general duty officer in a hospital, and at no time have I found that my duties if rightly carried out were other than such as would provide a range of variety and interest sufficient for any reasonable person. Almost all members of the Forces with the exception of medical and dental officers are completely divorced from their civilian occupations or are liable so to be. To us alone is granted the amazing good fortune of continuing our own work while serving in the armed Forces of the Crown, and, in addition, of being paid more than combatant officers of the same rank whose lives are infinitely more hazardous and strenuous than our own.

Surely these facts indicate that we should be humbly grateful for our good fortune rather than that we should complain and ask for greater blessings.—I am, etc.,

CHARLES ILIFFE,
Capt., R.A.M.C.

Wartime Appointments to Public Health Posts

SIR,—Some doctors may have managed to evade service, but there are very few in the public health service who have not come under the vigilant eye of the L.M.W.C. "Ex-Service M.O." (April 7, p. 54) overlooks the fact that it is very difficult to get any male medical officers for junior posts in this service, and most of these positions are now held by women, who are, indeed, more suitable for antenatal and maternity and child welfare work.

At the beginning of the war there were a certain number of men between the ages of 35 and 45 who had some slight disability which made them unfit for the Services. Perhaps these men had spent a large part of their lives in public health work and had managed to gain a senior position as deputy M.O.H. Not being 100% fit for the Services they worked in departments which were grossly understaffed or staffed by alien doctors in a greater or lesser degree. When the war ends they will be 41 to 51, and unless they get promotion during the war no local authority will employ them as medical officers of health at this age. Their position will be far from enviable, having devoted their lives to public service, to know that it has been all in vain to achieve the highest position.

Those men who were in posts when they volunteered or were called up rightly have those posts reserved for them. But what about the senior posts? The men entering the public health service after the war will find plenty of junior posts when the aliens return to their own country, but "Ex-Service M.O.," from the tone of his letter, seems to decry anyone who is not 100% fit and cannot join the Forces getting a permanent position. Most men now appointed to M.O.H. posts are relieving others in the Services, but of necessity there must be some permanent appointments.

Again "Ex-Service M.O." forgets the war duties thrown on the medical profession in local government and civil defence work: mass immunization, etc.; often called on to work through the "blitz," tunnelling under debris to inject morphine, night after night—such has often fallen to the lot of the public health doctor, who next day carries on his normal routine. Many "civilian" doctors have done as good a job for their country as some in the Services, and there are very few who would not rather be in uniform. While I fully agree that in some cases young men may have been appointed by local authorities to permanent posts, it should be borne in mind that such appointments are under the supervision of the Ministry of Health, whose sanction is needed, and in many cases appointments have been "squashed" by higher authority.

I am all for the ex-Service man's "rights," but he should view matters with a broad outlook and remember that his older colleague who gets one of the few permanent appointments is often also an ex-Service man of 1914–18.—I am, etc.,

London, E.C. EX-DEPUTY M.O.H.

Service Medicine as a Career

SIR,—Having followed the correspondence on medical demobilization and rehabilitation I am tempted to put in a word or two about those medical officers who would like to make the Service their career. While it cannot be denied that the majority of doctors who have served for several years have lost much clinical acumen, I must disagree with the assertion that "Service procedure" can be learned inside a couple of weeks. The duties of the Service medical officer, including, in the case of the R.A.F., the care and supervision of flying personnel, entail considerable specialized knowledge and experience. In my opinion "Service procedure" is a life-study, and to replace Service medical officers on any scale, despite the clinical experience of their successors, would hardly contribute to the existing Service medical standards.

At the same time, those of us who desire to remain in the Service have an equal need for the opportunity of further studies, particularly those who came in straight from university or an initial hospital appointment. The problem this must present to the Service medical authorities is fully realized, but I feel that many medical officers would prefer to continue using their Service experience to advantage were they given the prospect of postgraduate study before they, and the war, were much older.—I am, etc.,

E. HOPE LAMB,
Squad. Ldr., R.A.F.O.

Hospital Appointments and Serving Medical Men

SIR,—The University of Durham have recently indicated that they were prepared to appoint a professor of surgery, but would make no appointment until they were satisfied that persons serving overseas would have had a full opportunity of applying, and that the person appointed would not be required to take up his duties until such time as he was released from the Forces. The University of Manchester have also made a similar proposal regarding the professorship of medicine. On the other hand, I understand the University of London intends to fill the chair of psychiatry immediately —a proposal against which there has been a most justifiable outcry.

During the past few years while serving in the Forces I have been greatly struck and distressed by the very large number of brilliant young medical men, the majority of whom are married and have families, who have no assured position to which to return when hostilities cease.

My object in writing this letter is to suggest that a committee, analogous to the Central Medical War Committee, which by and large has done such good work, should be formed for the purpose of assisting to fill the numerous vacancies that will occur in the near future: there having been no appointments to the majority of the staffs of the voluntary hospitals since 1939. This committee could be constituted and act in various ways. My idea is that it should be formed mainly of serving medical men who are already on the staff of voluntary hospitals. These men know both the capabilities of the applicants and the requirements of the hospitals. The teaching hospitals, as such, would have no direct representation on the committee, as it could obtain any additional information the members might require from the various deans with whom the committee would be in close contact.

All voluntary non-teaching hospitals and the teaching hospitals who do not wish to select their staff necessarily from their old students would be asked to participate in the scheme, and to state how many vacancies would exist at the end of 1945. A list of these vacancies would be compiled and applications invited from serving medical men (a proportion of vacancies could be reserved for those in the E.M.S.), who would be asked to select three or four posts in order of preference. This committee would examine the applications and forward to the various hospitals a short list from which they could select the candidate whom they thought most suitable.

This scheme, if carried out, would have two main functions. It would give serving medical men, who have sacrificed so much, a feeling of security and an assurance that they were not forgotten, and it would also be an alternative to the idea of full-time State medicine, to which at present a large number are attracted for the sole reason that there appears to be nothing else. I feel that it is only those who are at present serving who realize how uncertain the future appears to those who have had almost six years of war and are now approaching middle age.—I am, etc.,

ARTHUR L. MCCURRY,
Hon. Ophthalmic Surgeon, Leicester Royal Infirmary.

Use of Mydriatics by Sight-testing Opticians

SIR,—I understand there is an agitation by the sight-testing opticians to obtain the right to use drugs in the refraction of the eyes. I am rather puzzled at this. Who has the power to give any layman, however skilful and clever, the right to do something which is in the province of the medical man? Surely only an Act of Parliament or an Order based on an Act and made by a responsible Minister can give that right. If no such Act be necessary and someone has the power to hand out this right, possibly after some form of examination, where is this going to end? Will it be the use of sedatives next, such as the barbiturates, or perhaps local analgesics? It is only the first step which counts; the rest is easy. The medical profession is open to anyone who will expend time and money and has the brains to enter it without trying the back door.—I am, etc.,

London. FRANCIS E. PRESTON.

Medical Man-power

SIR,—One is led to presume that the nation's call on doctors is not by any means yet over. Is the Regional Medical Officer part of the nation's call? I was surprised to receive an intimation from the local insurance committee that this inquisition was to start again towards the end of April.

Who can benefit by this? The answer can only be the approved societies, at whose behest the Ministry have no doubt decided to revive this useless branch. This is a reminder of the power of these societies and a foretaste of things to be expected from the "Minister," held up by many of our profession as a kind of infallible, omnipotent deity.

Has the Central Medical War Committee decided there are now enough medical men to be spared for this? Have they, in fact, been consulted at all?—I am, etc.,

Dudley. A. W. WESTON.

Change of Title of Kensington Division

Notice is hereby given to all concerned that the Council has changed the name of the Kensington Division to "Kensington and Hammersmith Division," the change to take effect from the date of publication of this notice.

CHARLES HILL,
Secretary.

Branch and Division Meetings to be Held

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Tues., May 1, 3.30 p.m., B.M.A. Lecture by Dr. Frank S. Airey: Skin Diseases in General Practice.

H.M. Forces Appointments

ROYAL ARMY MEDICAL CORPS

Major J. F. W. Meenan has retired on retired pay, on account of disability, and has been granted the honorary rank of Lieut.-Col.

Short Service Commission.—Lieut. (War Subs. Capt.) J. P. Scrivener, from Emergency Commission, to be Lieut., and to be Capt.

SUPPLEMENTARY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

War Subs. Major (now War Subs. Lieut.-Col.) B. E. Schlesinger, to be a Consultant, and has been granted the local rank of Brig.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Major H. M. Moran has relinquished his commission, and has been granted the honorary rank of Lieut.-Col.

War Subs. Capt. H. H. Watts has relinquished his commission on account of disability, and has been granted the honorary rank of Capt.

Lieut. V. P. McAllister has relinquished his commission, and has been granted the honorary rank of Lieut.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

War Subs. Capt. (Mrs.) M. Bradley has relinquished her commission.

The following M.O.s have been granted commissions in the rank of Lieut.: Laura J. Babst, Katharine N. Bentley, Elizabeth F. Cullis, Minnie K. Herring, Isobel M. Kerr, Margaret P. Laxton, Pearl A. I. Macleod, Alys P. Nelson, Lisbeth A. Redlich, Gwenllian E. Rees, Margaret S. Stevenson, Ambrosine B. Vaughan, and Inez M. Y. Petrie.

ROYAL AIR FORCE

AUXILIARY AIR FORCE RESERVE OF OFFICERS

Wing Cmdr. (Temp.) A. C. Fraser to be War Subs. Squad. Ldr.

ROYAL AIR FORCE VOLUNTEER RESERVE

Wing Cmdrs. (Temp.) G. A. Jamieson and D. F. E. Nash to be War Subs. Squad Ldrs.

Fl. Lieut. A. Craig has relinquished his commission on account of medical unfitness for Air Force service, retaining his rank.

Fl. Lieut. N. F. Murphy has resigned his commission retaining his rank.

Flying Officers K. T. Acton, M. Mendick, S. C. Rexford-Welch, R. J. C. Southern, and R. W. Watson to be War Subs. Fl. Lieuts.

WOMEN'S FORCES

EMPLOYED WITH THE MEDICAL BRANCH OF THE R.A.F.

Squad. Ldr. P. M. Fraser has resigned her commission.

BIRTHS

FAWKES.—On Easter Sunday, April 1, 1945, at Families Hospital, Secunderabad, India, to Hilary (*née* Holton), wife of Capt. M. A. Fawkes, I.M.S., a son—John Edward.

HAGGIE.—On April 15, 1945, at Stamfordham, Northumberland, to Capt. and Mrs. Haggie, a son.

HUTTER.—On March 3, 1945, to Mary (*née* Squiggles), wife of Surg. Lieut. Duncan Hutter, R.N.V.R., a son—Christopher Duncan.

MORSE.—On April 14, 1945, at Twyford Nursing Home, Bognor, to Hilda and Dr. P. W. Morse, a son.

TANNER.—On April 8, 1945, at Hammersmith Hospital, to Evelyn Winifred (*née* Glennie) and Norman Tanner, a son.

DEATH

CHAPMAN.—On March 16, 1945, suddenly, at Winnipeg, Manitoba, Theonie Rennée Chapman, M.B., B.S., B.Sc., sister of Cedric Burrell, Crofton, Twyford, Winchester, Hants.

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY MAY 5 1945

HEARD AT HEADQUARTERS

A Deputation to Mr. Butler

Since the letter from the B.M.A. to the Minister of Education was published in the *Supplement* a fortnight ago Mr. Butler has reconsidered his decision and has agreed to receive a deputation on the much-debated question of the school medical service under the new Education Act. The overriding consideration which the deputation will urge upon him arises, of course, from the unprecedented shortage of doctors, which makes it impossible to meet to the full the requirements under the new Act.

The shortage is indeed recognized in Circular 29 which the Ministry addressed to local education authorities a few weeks ago. The latter were, in effect, told to "go slow" in this matter. The position, however, appears to be that certain education authorities, quite properly and legally from their point of view, are ignoring the advice to go slow, and will try by setting up clinics, etc., to meet at once the full demands of section 48 (3). What the Association is anxious to do is to ensure that advantage is not taken of the present situation to change the face of medical practice in advance of the Government's declared intention to introduce a comprehensive health service as part of its reconstruction policy.

If the Minister is unwilling to introduce amending legislation postponing these provisions of the Act—and the unwillingness of any Minister to do so when an Act is less than a year old is understandable—the deputation will point out that any development should recognize the shortage of doctors and should be a matter, in each area concerned, for consultation with the local general practitioners. Though the service cannot function completely, there is every reason for integrating general practitioners into the school medical service even in the interim stage.

The General Practice Committee of the B.M.A. held a special meeting last week, when almost the only business was consideration of this matter.

Medical Man-power

Not even the most prejudiced person, presumably, will accuse the Association of raising a fictitious issue in the shortage of medical man-power, which affects so many matters of medical concern to-day. This shortage stares everybody in the face. What is more, it is likely to continue for many months to come. It is said that no general demobilization of doctors can be expected in the near future, that the Services will still exact their full quota, and that for as many as doff their uniform there must be an equal number who put it on. The war in Asia will call for reinforcements, perhaps, before the war in Europe is ended, and in Europe the occupation armies will need full medical service. Then there are other tasks—U.N.R.R.A., for example, and, at home, a multitude of new duties relating to resettlement and rehabilitation. The shortage of doctors and the pressure upon them are no myth, and the same thing applies to nurses and other auxiliary services. It will be one of the outstanding features of the situation for a very long time.

Approximations

Complaints have been received from members of the B.M.A. of the inadequate fees paid to civilian medical practitioners for occasional attendance on Service personnel and Italian prisoners of war. At its last meeting but one the General Practice Committee resolved to open up discussions with the War Office and other Service Departments on the subject. It suggested an increase of fees to 5s. for attendance at the surgery, 7s. 6d. a visit if not more than two miles away, 15s. for a night visit, and mileage at 1s. a mile (one direction only). The War Office reply, which was communicated to the committee last week, goes about half the distance. It thinks 33⅓% increase on pre-war fees will meet the case—4s. for surgery attendance, 6s. for day visit, 9d. a mile, and for a night visit the wholly inadequate fee of 8s. It has been decided to send a deputation to discuss the matter.

Doctors' Cars

Doctors' cars get worn out sooner than most, and replacement is now difficult. Recently some representatives of the B.M.A had a frank talk about this at the Ministry of Transport. No new cars are being issued at present for civilians, but the Ministry gave an assurance that as soon as new cars are available the Association will be informed of the steps necessary to obtain priority in delivery. At the same time there are a certain number of cars which are surplus to Service requirements, and after being reconditioned may be available for those who can establish prior claims, and at prices not unreasonable compared with those in the used-car market. The demand for these cars will certainly be greater than the supply, but the Ministry promised to give a high degree of priority to doctors.

Equal Pay

The B.M.A. committee on equal pay, under the chairmanship of Prof. Picken, performed a very useful service in preparing a memorandum of evidence for the Royal Commission. The task was not difficult, because the policy of the Association in this matter has been clearly laid down; but the committee put the matter succinctly on the ground of national policy that there should be full equality between medical men and women in pay, terms of service, and opportunity for work. As regards married women doctors holding appointments, where in some cases the demands of home and children may introduce difficulties, it was suggested that the question was an individual one, to be considered in each case by the officer concerned and her employers, not a question to be settled by the old rigid rule of compulsory retirement on marriage.

One other point has arisen more lately. Some time ago the Medical Women's Federation drew attention to the difference in the cost-of-living bonus based on the Civil Service scale for men and for women doctors in L.C.C. appointments. The bonus is now 23s. a week for men and 18s. 6d. for women on salaries up to £1,500. The Council of the B.M.A. felt that this raised wider issues, beyond the sphere of professional activities, and that it could take no effective action. Further protests have since been made against the sex difference, and it has been pointed out that in so far as the cost-of-living bonus is a form of remuneration—and the bonus is not given for services rendered, but to meet the increase in cost of living—the Association is bound by its declared policy against sex differentiation. The Committee on Equal Pay draws attention to the anomaly, but it realizes that the Commission, to which its memorandum is addressed, is not primarily concerned with this matter.

SOME COMMENTS ON THE REPORT OF THE GOODENOUGH COMMITTEE ON MEDICAL SCHOOLS

BY

H. J. McCURRICH, M.S., F.R.C.S.

The medical members of the Goodenough Committee were, with one exception, teachers, the exception being the Principal Medical Officer to the Ministry of Health. One would expect, therefore, a certain bias in favour of the present arrangements and an extension of them. In the report of this committee a good deal of lip service is paid to the training of students to become general practitioners. It is stated that a general practitioner should "be competent to diagnose and treat all simple disorders, including milder forms of mental ill-health, etc. . . ." (para. 5, p. 40).

Now, does the present training fit him to do so? It is hard to see what justification can be found for the hours that students stand in serried ranks watching such operations as partial gastrectomy, thyroidectomy, abdomino-perineal excision, Fothergill's repair operation, etc. Instruction in this detail is not given by a competent instructor in such an operation as circumcision, nor in the treatment of conditions like sprained ankle, tennis-elbow, painful feet, warts, etc.

The financial success of "foot clinics" and manipulations of various types must be taken as a measure of the failure of the medical profession. I remember talking to a fellow member of a lawn-tennis club who told me that he had had his tennis-elbow cured by a bone-setter. I asked him why he did not consult his doctor. He said: "What would have been the use? He would only have put iodine on it." Knowing the doctor, I dare say he was right. Many patients whose doctors have failed to treat some more or less trivial but very disabling lesion have found relief from the unofficial practitioner. I don't want to exaggerate this, but equally it is futile to deny it.

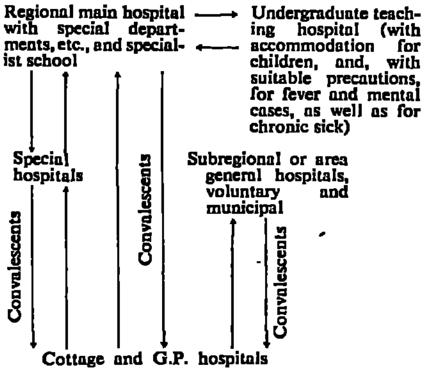
What experience of mental disease does the average medical student get? The visit to the asylum in my day was looked upon as a picnic, and "anyway they were never asked about it in the final." The same is largely true of children's diseases, skin diseases, and fevers.

Whether this is due to specialization of the staff with many special departments making it impossible for the students to work in each, or to jealousy of these special departments by the general physicians and surgeons, who retain students in the general wards as long as they did before special departments were created, is a matter of opinion. This jealousy and reluctance to part with work are often carried to curious lengths. I remember a senior surgeon in a teaching hospital who, while accepting responsibility for treating fractures, never looked at the cases, but left them to his house-surgeon, who, presumably, learnt from a previous house-surgeon; yet this same senior surgeon opposed the formation of a fracture clinic. Whatever may be the reason the students' work in such special departments as those for children's diseases, psychiatry, orthopaedics, E.N.T., is limited as a rule to a few out-patient sessions.

Obstetrics, which should form an important part of general practice, is passing, in the case of the poor, into the hands of midwives, and, in the case of the rich, into the hands of specialists. I am not referring to complicated but to normal confinements. In part this is due to inadequate experience before entering practice.

Scope and Duties of Teaching Hospitals

I feel that the failure to produce the best possible G.P.s is the result of a muddled outlook and conception of the duties and scope of a teaching hospital. At present it claims to be: (1) an institution for the training of undergraduates; (2) the pinnacle of the hospital system with the best exponents of the most difficult techniques; (3) a place of training for postgraduates. Are these functions compatible with each other or contradictory? I believe they are contradictory. Assume for a moment that I am correct. An entirely new conception of the hospital problem will be required. The teaching hospital will be a special hospital, and will be on a side-track or bracket of the hospital system. I would suggest the following scheme:



Regional main hospital with special departments, etc., and specialist school
Undergraduate teaching hospital (with accommodation for children, and, with suitable precautions, for fever and mental cases, as well as for chronic sick)
Special hospitals
Convalescents
Convalescents
Subregional or area general hospitals, voluntary and municipal
Convalescents
Cottage and G.P. hospitals

I admit that this is a novel idea and will therefore be viewed with suspicion, but consider the possibility of this scheme being adopted. In the regional main hospital: (1) technique will not be hampered by clumsy and inexperienced assistants; (2) specialization need not be determined by the needs of students but only by the welfare of the patients; (3) team experiments in specialization and technique will be possible; (4) there will be no harm in clinicians interested in a special condition collecting a series of cases. Thus a cardiologist will be able to fill his beds with heart cases, and not be compelled to take in a variety of others in which he takes little interest and for which no one consults him in private practice, just to provide general clinical material (though possibly not instruction) for students. In such a hospital the postgraduate anxious to specialize will find his opportunity.

In the teaching hospital it will be possible to deal with the common conditions, but payment of the staff will have to be on an entirely different basis, because they will be training undergraduates to treat the cases and not impressing future customers with their skill or wisdom! At present clinicians seek election to the staffs of teaching hospitals because it leads to a good consulting practice through the prestige it confers and the contact that is made with the future doctor. For these benefits the holder of the appointment must give up a certain amount of time, more or less unremunerated, to teaching. Some pay this price more readily than others. Some like teaching, but others are apt to place their private practice first, to be irregular in their attendance at the teaching hospitals, to cancel classes, and to take little trouble with the students.

Multiple Appointments

It has been suggested that in any scheme of liaison with the non-teaching hospitals "specialists and consultants on the staffs of teaching hospitals . . . will not as a rule be able to undertake regular duties in non-teaching hospitals" (p. 15 (2)). The question of multiple appointments is just touched upon in this report (para. 45, p. 75), but it has already given cause for anxiety to those interested in medical education. There has been an increasing tendency in the last 50 years for clinicians on the staffs of teaching hospitals to acquire appointments in cottage or suburban hospitals as well. Why has this tendency arisen, and how does it affect the teaching hospital? It has arisen because, with the growth of these hospitals and the private beds usually attached to them, much of the private work in the area, especially the small- or medium-fee cases which form the backbone of any practice, is done at those hospitals. In return for his unpaid hospital work the consultant is given more or less a monopoly of the private work of that hospital and the area for which it caters.

How does this affect the teaching hospital? Complaints have been made that clinicians on the teaching hospital who hold appointments on suburban hospitals are apt to give the latter priority. If a doctor, who may be a good client, wants the services of the consultant urgently at the cottage hospital, the consultant is compelled to go there, and get a deputy to do his work at the teaching hospital. If he does not, the cottage hospital might have to appoint a second consultant and he would lose his monopoly. In some cases serious complaint has been made that the holders of teaching appointments are gravely neglecting their duties at the teaching hospital for these reasons.

A further cause for seeking additional appointments is the lack of a suitable population around the teaching hospital or in the area mainly supplied by it to provide private practice. The reason for this is either, as in the case of Central London, the population has left the area or the hospital has moved to a poorer district where its gratuitous service is more needed but the possibility of building up a consulting practice is diminished. The growth of provincial hospitals and consulting areas further diminishes the scope of the private practice of the teachers.

The problem, therefore, is really economic. So far as I know, in no other profession is teaching carried on in this way. In other professions students are not taught in the hope that they will become future clients; teaching is a profession in itself and the remuneration of the teacher is for teaching. This would probably mean that the "stars" of the profession would not teach. One does not go to the Albert Hall to hear a recital by a professor of music. In engineering, such projects as the Forth Bridge or Sydney Bridge were not designed by a member of the staff of an engineering school. The same applies to law, though in both engineering and law there are modifications due to the apprenticeship system.

Would the withdrawal of the best performers from undergraduate teaching really diminish the value of the teaching? I believe that far from doing this it would enable teachers, appointed and paid for teaching without ulterior motives, to pay particular attention to those who are to become G.P.s, to inculcate principles, and to stress the details of such treatment as a G.P. should be able to give, rather than to use valuable time in teaching the details of proceedings the student will not himself undertake.

A school founded on these lines should produce good G.P.s, and this should in every case be the first objective of the medical student. The suggestion in the Goodenough report that Oxford should cater specially for students who can be expected to become "teachers, investigators, and consultants rather than general practitioners" (para. 14, p. 23) is a most pernicious one. Is it possible for the student at the outset of his career to say for himself if he is likely to fall within these categories? Or would it be possible for anyone else to predict it for him? Can one say in medicine that ev[illegible] is born a consultant or G.P.?

That such a step is approved by the Goodenough Committee is deplorable, and seems to reflect a very narrow outlook. At present G.P.s are trained entirely by consultants who, as a rule, have never been in general practice. This tends to put general practice in the position of being a calling for those unable or unfitted to become consultants, and the Oxford suggestion crystallizes this outlook.

No doubt recent tendencies and State medicine tend to limit the doctoring by the G.P. while increasing his clerical and "sorting" duties. The limitation is part of a cycle. He is in many cases, as in the Army, limited to doing almost nothing, because what he did, he did so badly;—he did it badly—e.g., the injection of varicose veins, haemorrhoids, etc.—because he was taught by those who were not interested in such things, and he either never learnt or learnt from juniors who were not competent to carry out these procedures.

General practice has possibilities of being the most interesting branch of the profession, and if students were properly taught to become G.P.s it would no longer be looked upon, as it appears to be from this report, as the rubbish dump for those who fail to become consultants or specialists. The possibility of the more experienced and able G.P.s acting as consultants to juniors, or the reintroduction of some form of apprenticeship, should be borne in mind.

If the undergraduate schools were remodelled with these aims in view it would be desirable to appoint a number of general practitioners to the staffs of teaching hospitals. Such undergraduate hospitals would, in addition, cater for G.P.s requiring postgraduate refresher courses. Postgraduate instruction for specialist and consulting practice would be given elsewhere. Here the "main hospital" in my scheme would be the natural centre, together with special hospitals. The candidate for specialization would have already a wide general training upon which to build up his specialty. In fact many believe that a year or two as a general practitioner before starting specialism would be all to the good. On the other hand, time is a factor, and either a specialist would have to be supported financially during his training or the subsequent pay would have to be such that it would justify his having lived for so long on his own means, or, as many have done in the past, lived from hand to mouth by "deviling," coaching, etc., until he made good. The remuneration of consultants under a national scheme has not been discussed, but, judging by past and present Government payments, it seems unlikely that it will be enough to entice a man to spend, say, ten years in unpaid, or almost unpaid, hard work to attain it.

These, then, are some of the reasons for believing that undergraduate teaching should have a special place, and should be regarded as a career and not as a side-line to consulting practice. And if this view is accepted the training of specialists and consultants should be conducted elsewhere after graduation. There seems no justification for the view that specialists should be trained to be so from matriculation days.

HEALTH POWERS OF LOCAL AUTHORITIES

ENVIRONMENTAL AND PERSONAL SERVICES

The possibility of changes in local government following upon a National Health Service Act, together with transfers and enlargements of functions of local bodies, and adjustments of area boundaries for all or for certain health purposes, makes it useful to set out briefly the present health powers of local authorities. Such powers derive from a number of Acts of Parliament, dating back for a hundred years. Systematic sanitary legislation began with the Public Health Act, 1848, which was inspired by Chadwick. The principal Act until recently was that of 1875, now repealed and re-enacted in the Act of 1936. Public health services may be roughly classified into environmental and individual, the former presenting the first and most obvious field. Only in this century has there been any large invasion of the domain of personal health. The major local authorities are now owners and administrators of large hospitals, not only, as was formerly the case, institutions for the sick poor, for mental disorder, and for infectious illness, but general hospitals for every type of case.

The prevention and treatment of disease is distributed among various types of local authorities—public health, education, and public assistance committees, which are committees of the elected authority, and, on a different basis, insurance committees administering the National Health Insurance Act. The environmental services of local authorities make a lengthy list. They include the inspection and abatement of nuisances, not forgetting smoke and atmospheric pollution; drainage, sewerage, and sewage treatment; street cleansing and refuse disposal; regulation and inspection of common lodging houses and of a large number of workshops and workplaces; the provision of open spaces; inspection under the Housing Acts; slum clearance schemes; investigations into the particular sanitary circumstances of hospitals, schools, institutions, and other premises; the cleansing of verminous persons, premises, and articles; and a periodical review of the sufficiency and wholesomeness of the water supply (80% of the water undertakings of the country are in the hands of local authorities).

Under the Food and Drugs Act, 1938, the responsible local authorities are the county and county borough councils and the councils of boroughs and urban districts with populations of over 40,000, while authorities with populations down to 20,000 may apply to the Minister to become, or remain, food and drug authorities. The powers of local authorities in the matter of food protection are extensive; they cover every article used in the composition and preparation of food, and the control of slaughterhouses and of premises used for the manufacture and sale of certain specified foodstuffs. An Act of 1944 transferred to the Ministry of Agriculture the function of health authorities concerning the conditions under which milk is produced on the farm.

The housing powers of local authorities include the provision of working-class houses, control over the dimensions of inhabited rooms, and the provision of sanitary conveniences. Councils are required to arrange for surveys of their areas to ascertain any houses which may be unfit for human habitation, or any in which there is overcrowding according to the standard laid down.

Control of Infectious Diseases

The powers of local authorities in respect of infectious diseases originated with the old boards of guardians, whose powers passed to the present local authorities under the Local Government Act, 1929. A number of diseases have to be notified to local authorities, and it is within their power, with the Minister of Health's approval, to make local additions to the list. Every medical officer of health has to furnish each week to the Registrar-General a return of all cases of infectious disease notified in his district. The measures which a local authority may adopt in order to control the spread of epidemic disease are isolation of the infected person, search for the source of infection, observation of contacts, disinfection, and, in appropriate cases, vaccination. Infant vaccination against smallpox is compulsory, but during the last forty years there has been little or no effort to compel the observance of the Vaccination Acts.

Most local authorities, acting under the Public Health Act, 1875, or the Isolation Hospitals Act, 1893, have provided hospital accommodation for cases of infectious disease. Treatment in such hospitals is provided by councils of boroughs and of urban and rural districts, but not usually by county councils. Under the Local Government Act, 1929, county councils were given the function of drawing up local schemes for adequate isolation accommodation, but the carrying out of such schemes generally remains with the district authorities. Of the 1,500 local authorities in England and Wales with powers to provide for the hospital treatment of infectious diseases, about 800 have combined for this purpose into 160 joint boards. The London County Council has 16 hospitals for infectious diseases, together with a unit for post-encephalitis lethargica, and a receiving station for smallpox patients, also a hospital for ophthalmia and another for contagious diseases of the skin.

An important part of the preventive work of local authorities is the publication of advice and also lectures on health and disease. The campaign for diphtheria immunization is an example.

In 1921 Parliament imposed a general duty on county and county borough councils to arrange for the treatment of tuberculosis. This is one of several instances in which local authorities act in co-operation with voluntary bodies. The authorities provide dispensaries, which are receiving-houses, where patients are examined, advised, and treated at home, or are drafted into sanatoria and other institutions. The authorities have an interest also in after-care, village settlements, and tuberculosis colonies. Thirty-three tuberculosis dispensaries are maintained by the Metropolitan borough councils. The pivot of the system is the tuberculosis officer.

The venereal diseases service of local authorities dates from the last war. It is the responsibility of county and county borough councils to provide the necessary clinics and centres and to arrange for hospital beds and hostels. Another field for local authority intervention in public health was afforded by the Cancer Act, 1939, whereby local authorities were charged with seeing that facilities for the diagnosis and treatment of cancer were available. The war has prevented the scheme from materializing except for certain interim arrangements.

Maternity and Child Welfare

Service under the Maternity and Child Welfare Act, 1918, is provided by local authorities, including the urban and rural district councils. Membership of the authorities' committees which supervise this service is open to others besides councillors, and at least two of the members must be women. The provision includes ante-natal and post-natal care and welfare centres. In the case of women who have their confinements at home a midwifery service is established under the Midwives Acts. The local supervisory authorities under these Acts are the county, county borough, and urban and rural district councils, who supervise the services of independent midwives and see that domiciliary facilities are available in the area. An important task of county and county borough councils is the registration and inspection of maternity homes, a requirement extended by a subsequent Act to nursing homes in general.

Under the new Education Act it is the duty of every local education authority to provide for the medical inspection of pupils in attendance at any school, and the parents of any pupil may be required to submit him for such examination, and free medical treatment. The authorities must make provision for blind, deaf, defective, and epileptic children. (The mention of the blind reminds us of the obligation on the local authority to make such arrangements as it thinks desirable for assisting in the prevention of blindness and for the treatment of persons suffering from disease of or injury to the eyes.)

A Hospital Authority

As already stated, since 1930 county and county borough councils have made general provision for ordinary hospital cases, not merely for the chronic sick, the incurable, and the senile, which was the legacy left to them in the old Poor Law infirmaries. Many of the former infirmaries have been converted to this new use. Just before the war there were 70,000 beds in 140 general hospitals maintained by local authorities under public health powers and nearly 60,000 more in 400 hospitals administered under the Poor Law. It is not the statutory duty of local authorities to see that there is hospital provision for the whole population in their area, but in effect the larger local authorities have exercised their powers to provide hospitals in such a way that, together with the voluntary hospitals, the most urgent needs for hospital accommodation are met. A consultant and specialist service is provided in connexion with these hospitals, also a pathological service. The L.C.C. maintains a number of pathological laboratories for groups of its hospitals, as well as a central histological laboratory, two antitoxin establishments, and three chemical laboratories, with another pathological laboratory for its mental hospital service.

Ambulance services, which as a rule started in order to deal with street accidents, are now organized by local authorities for the removal not only of the injured but of the sick and for maternity cases. Yet another service derived from the old days of Poor Law relief is the provision of medical attendance and medicines for those who cannot afford to pay for a doctor. It is carried out by district medical officers, mostly part-time. Nursing attendance in certain cases may also be provided, and for this purpose a council may enter into a financial arrangement with voluntary nursing associations. The authorities have limited powers to employ nurses for domiciliary nursing of patients suffering from infectious diseases or expectant or nursing mothers or children under 5.

Finally, what was once a separate service but is now regarded as an integral part of the public health services of a local authority, the provision of care and treatment under the Lunacy and Mental Treatment Acts, falls upon the councils of counties, of county boroughs, and of a few non-county boroughs. The powers concerning certified patients are obligatory and concerning voluntary patients permissive. They are exercised through visiting committees, and in London and certain other counties local Acts have brought these visiting committees into line with the normal committees of the local authorities.

The care of mental defectives under the Mental Deficiency Acts is the responsibility of county and county borough councils, which are required to appoint a committee for this purpose. They provide institutional care for those who need it, and care within the community for defectives who are placed under guardianship or supervision. In these two fields of mental disorder and mental deficiency joint action by neighbouring authorities is not infrequent.

There are still other aspects of local authority intervention in public health on which we have not touched. One is infant life protection, another the provision of baths and wash-houses, a third the special health provisions relating to particular sections of the community, such as hop-pickers, van-dwellers, people working on canal barges, and so forth. The subject is very far-reaching and detailed. The reader who would like to pursue it may be referred to J. J. Clarke's *The Local Government of the United Kingdom* (London: Pitman, 1939), a volume of close upon 1,000 pages.

MEDICAL STAFF COMMITTEES

The following note on medical staff committees in Middlesex County Council hospitals has been received from Dr. J. B. Cooke, Medical Director, West Middlesex County Hospital, Isleworth.

In view of recent correspondence in the medical press relating to medical staff committees in county and municipal hospitals, it seems opportune to describe the way in which these committees function in the hospitals under the control of the Middlesex County Council, and to outline some of the results achieved during the two years they have existed.

The idea was not new, for at more than one of the council's hospitals unofficial consultations between the medical director and the senior members of the staff had been customary for years. The innovation was the official recognition by the county council of a medical staff committee as an integral part of the administrative machinery of each of the hospitals under its control. The medical director is expected by the county council to consult the medical staff committee on matters concerning the development of the hospital, changes of policy, and appointments of medical staff, in order to enlist its co-operation in dealing with matters affecting the welfare of the patients and staff. All members of the medical staff committee are made aware of the many problems and difficulties of an administrative nature which constantly arise in a hospital, and all are expected to accept their share in solving them.

In each hospital the medical staff committee consists of all the full-time permanent members of the senior medical staff, together with one or more representatives of the junior staff, who are elected by their colleagues. In addition, visiting specialists may be invited to attend when matters concerning their own departments are being considered. In this way the size of the committee is kept within reasonable limits, and specialists are represented. Slight variation in the personnel of these committees is permitted because conditions are not the same in all hospitals, and it is thought desirable that each hospital should maintain its own individuality. Each committee elects its own chairman, who is not necessarily the medical director.

A member of the medical staff committee in each hospital has the right to attend meetings of the Committee of Management in order to represent the medical staff and, if necessary, to state their views. The medical staff committee receives in advance a copy of the agenda and all relevant reports before the meeting of the Committee of Management. In addition, when an assistant in any department is to be appointed, the senior physician, surgeon, or obstetrician concerned accompanies the medical director to the Committee of Management to advise in the selection and appointment of the candidate.

The following list gives some idea of the number and variety of subjects submitted by various medical staff committees for consideration by the county council:

Food.—A comprehensive scheme for purchasing, handling, cooking, and distributing food in a county hospital, envisaging the complete removal of responsibility for catering and cooking from the steward and the matron and the appointment of a catering supervisor together with an adequate staff of dietitians, cooks, and kitchen workers.

Post-war Staffing.—A scheme for staffing county general hospitals and for undergraduate and postgraduate instruction.

Post-war Reconstruction.—Detailed examination in consultation with the architect of post-war plans for rebuilding and extension of the hospital.

Health of Nursing Staff.—Prolonged discussions between representatives of the various hospitals upon the health of the nursing staff, resulting in a co-ordinated scheme for periodical medical examination of nurses.

There were also discussions with almoners resulting in better co-operation; on cross infection in the hospital; on the efficacy of disinfectants used; and on certain deficiencies in the working of the out-patient department with suggestions for improvement.

The function of the medical staff committee is primarily advisory, and an effort is made to arrive at a constructive conclusion in every instance. It is realized that even though the recommendations may not be accepted they at least receive due consideration. It can be claimed, as a result of two years' experience, that the scheme is a success. Much valuable work has been done by the medical staff committees in the Middlesex County Hospital service, and, moreover, the system is popular because it gives to the senior medical staff a voice in the direction of policy of the hospital in which so much of their working lives is spent.

The principle of consultation with professional colleagues is also adopted by the county medical officer, who holds meetings of the medical directors and of representatives from the various medical staff committees before submitting far-reaching proposals to the county council.

Correspondence

Postgraduate Training for Service M.O.s

SIR,—The suggested provisions for postgraduate training for doctors leaving the Forces are not unrelated to the proposed medical service. If the Minister of Health really considers that a refresher course of two weeks is sufficient for a doctor returning from years in the Services or five guineas (the sum suggested) sufficient to pay for a locumtenent, he is sadly out of touch with the realities and finance of general practice. If, however, these restrictions are due to Treasury control the financial outlook for the new service is bleak indeed.

If properly planned and executed these refresher courses would give an opportunity of raising the standards of a whole generation of medical practitioners to an entirely new level, and no pains or expense should be spared to seize a chance which can never recur. No equivalent expenditure is likely to be so fruitful in improving medical practice and doing as much as medicine can do to improve the health of the population. These proposals are a real test of the intentions of the Minister and the Government.—I am, etc.,

Winsford. W. N. LEAK.

A Fundamental Point

SIR,—Dr. Leigh Hadley (April 21, p. 62) has drawn attention to what he describes as a fundamental point in the consideration of this proposed National Health Service. By so doing he has, even at this late stage in the "great betrayal of the medical profession," done a timely service in the fight for our freedom. There can be little doubt that the majority of us will agree with him in paying "tribute to the great work of our negotiators and the efforts they are making to obtain the best service possible." He should have added the qualifying phrase "under the circumstances." He would also, perhaps, have expressed the matter better had he substituted "terms" for "service."

The report on the negotiations by the Council which we have had before us, but for which no reasonable time has been given for proper consideration, appears on the first reading of the "Alternative Structure" proposals to be on the whole satisfactory. At first blush it would seem to support the view expressed by some sections of the Press, perhaps somewhat prematurely and manifestly to the considerable annoyance and embarrassment of the Minister of Health, that the profession had won something in the nature of a resounding victory. We have, however, without delay been authoritatively informed that this is a complete misapprehension. The "Alternative Structure" is purely in the nature of tentative suggestions which the Minister might possibly consider and even recommend some part of them if he were in a benevolent mood. That and nothing more. Moreover, on a more careful analysis of the details of the "Alternative Structure" it becomes increasingly obvious that even if they were accepted *in toto* they are so framed that there is no kind of guarantee that any of them would materialize in practice. The points apparently gained are, in the main, the right of the profession to "advise" and the obligation of the Minister to "consult." As Dr. Leigh Hadley asks, what guarantee have we that the present Ministry, let alone any subsequent Ministry, will accept advice or be under any obligation to adopt the conclusions of consultations? The whole history of our dealings with the Government in matters relating to National Health Insurance proves that no kind of reliance can be placed in any Ministry or Government undertaking.

The persistent simple-mindedness of the profession in their naive acceptance of the bona fides of Government officials is nothing short of amazing. I have attended all the important regional meetings since the White Paper first came under consideration, and it has been and remains an amazing phenomenon that the consideration of *the fundamental issue* has never been seriously undertaken. The time has been taken up in groping through the fog of administrative detail on the assumption from first to last that the profession had already accepted a Government medical service as inevitable. When the full history of this "great betrayal" comes to be written, this will prove to have been the fundamental tragedy of the whole sorry business. Dr. Leigh Hadley has stated the truth, the whole truth, and nothing but the truth when he says that our right course is to refuse altogether to have anything to do with a Government medical service, however good it may be made to appear. Do we want control? Do we want our profession sold into bondage? The answer to this fundamental question has never yet been given voice. Every conceivable subterfuge has been used to prevent the giving of a straight answer to a straight question. —I am, etc.,

Oxford. J. FRANKLAND WEST.

100% Service

SIR,—Dr. W. D. Gray (*Supplement*, April 21, p. 62) is of opinion that the British citizen "*must not be allowed to waste money on private consultations*"; and that "doctors must be deterred from exploiting such ignorant folly." Should I be mistaken in regarding this as "control" *in excelsis*? What measures would he take to abrogate a citizen's right to spend his money how he likes? Would he advocate removal from the *Register* of the names of all practitioners who refuse to take service under the Act? There are many who think—with some justification—that the heyday of the unregistered practitioner and the quack will begin when the National Health Service Act goes on the Statute Book.—I am, etc.,

Brookwood. H. M. STANLEY TURNER.

Alien in Principle

SIR,—It is abundantly clear that the purchase and sale of medical practices need never be legally prohibited, since even the possibility of the introduction of a State medical service has considerable reduced the numbers of purchasers, and also reduced the price they will pay. If a 100% State medical service were introduced very little time would elapse before the numbers of purchasers and the price they offered would both be reduced to *nil*. Thus the Government need pay no compensation whatever for the lost capital value of a practice, because it would still be legally permissible to sell the practice, though in fact it would be impossible to do so.

The vast majority of doctors I have met in the Services do not wish to be employed by the State for the rest of their lives. After eleven months in general practice and four years and eight months in the R.A.F. during the war, it is my conviction that the spread of State control to embrace all doctors and all patients would be catastrophic for both parties, and would destroy the doctor-patient relationship as we once knew it and hope some day to know it again—a relationship of mutual confidence, not marred by suspicion aroused from conflicting loyalty to a third party: the impersonal yet all-powerful, State.

Let those who prefer a controlled career enter the existing public health service or take permanent commissions in the armed Forces. But surely the shackles of complete State control need never be fastened upon us all if we take the only action the Government would be likely to understand while yet there is time—namely, discontinue negotiations for a State medical service along the lines of the White Paper. This course of action is recommended by Dr. Leigh Hadley (*Supplement*, April 21, p. 62) for another reason. While endorsing his remarks, these further reasons are submitted for discontinuing the negotiations along present lines, in the sincere hope that the prolonged and bitter struggle against foreign totalitarianism will not be proved futile by the setting up in Britain of a State medical service, so alien in principle from the freedom for which we are fighting.—I am, etc.,

J. MAXWELL JONES,
Squad. Ldr., R.A.F.V.R.

Medical Demobilization

SIR,—Now that the European war seems to be drawing rapidly to a close, we feel that it is opportune for us to bring up the question of demobilization of medical officers. Having joined the Service after a certain amount of experience in civilian hospitals, our sum total of experience cannot compare with those more fortunate medical men who have held posts in the E.M.S. or other reserved establishments during these long years. We feel very strongly indeed, and believe our view to be shared by the majority of our temporary Service colleagues, that the time has come when some reallocation of medical manpower can take place which would enable those of us who have served for a considerable length of time in the armed Forces to gain some experience of civilian work and fill in the gaps in our knowledge.

Although we get our *Journal* rather late out here, and it is difficult to follow medical politics, we have gathered that it is proposed to release civilian doctors from a liability to service after the European war is over, and the gross unfairness of such a move has been apparent to us all. Surely after the long separation from their families and unsettled domestic life medical men in the Service should have first priority in demobilization, and, if necessary, their places could be filled by those who have been reserved.

We consider that an exchange scheme between civilian and Service medical officers should be instituted immediately, whereby civilian hospitals and organizations would be unable to retain medical officers on the plea that they could not be spared. This applies particularly to the more senior appointments, where the tendency to regard an experienced man as irreplaceable is greater than with junior posts. If it is then found that doctors can be spared from the E.M.S. and other civilian organizations those who have had longest service in the armed Forces can be demobilized first, and, while waiting for demobilization, will have an opportunity for study with clinical material which is unrestricted by age group and by the effective filter of the National Service Medical Boards.

An additional point is that those of us who were not established in a permanent practice or on the staff of a hospital at home are not likely to have their release from the Service requested by the Local Medical War Committees, to whom they are unknown, and their prospects of return to hospital or other appointments are, therefore, to say the least, gloomy. In short, we feel that those who volunteered for service in the early days of the war may soon be subjected to grossly unfair treatment if the civilian doctors are demobilized without first of all relieving those in the Services, and, in view of the trend of the war, we consider this to be a matter of the utmost urgency.
—We are, etc.,

FROM THE PRESS CUTTINGS

"If large numbers of people view with grave misgivings and even with dismay the threatened progressive extension of State control over all departments of life in this country, it is because this means inevitably the entrusting of what can become arbitrary and almost unrestricted power to pullulating swarms of State officials whose actions the ordinary citizen will find himself powerless to resist because he will be up against an entrenched vested interest."—The Rev. L. B. Ashby in the *Daily Telegraph.*

"And now they [the schools] are suddenly entrusted with the whole medical treatment of children. What facilities have they for that? None whatsoever; no hospitals, no nurses, no doctors, no diagnostic clinics. . . . The school medical service has no knowledge of the child's environment, its home, its heredity, its medical history at birth and in infancy. All these essential facts are usually known to the family doctor. Then if the family doctor is called in to help the school service the chances are he will be sent to the wrong school—to a school where he knows none of the children, and his whole personal value is destroyed."—*Daily Express.*

FACULTY OF OPHTHALMOLOGISTS

As announced in the *Journal* of Feb. 3 (p. 160) the Council of British Ophthalmologists has sponsored the formation of a Faculty of Ophthalmologists, which it is intended should be a body representative of all British ophthalmologists. The Council of the Faculty was elected by ballot and consists of regional and national representatives. The result of the election was as follows:

Regions	*Members*	*Associates*
1	George Black	—
2	Ida Mann	Doris Rose
3	W. Niccol	Moreen Whelton
4	Frank W. Law	J. A. Chivers Stewart Macky
5	W. J. B. Riddell	—

National Representatives (Members)

R. C. Davenport
P. G. Doyne
Sir Stewart Duke-Elder
O. M. Duthie
C. B. Goulden
F. A. Juler
E. F. King
Sir John Parsons
H. M. Traquair
F. A. Williamson-Noble

At its first meeting the council elected the following officers: President, Sir Stewart Duke-Elder; Vice-President, F. A. Juler; Hon. Treasurer, F. A. Williamson-Noble; Hon. Secretary, Frank W. Law.

The criteria of membership and other details were necessarily temporary. These will require modification, and with this in view a meeting has been arranged, under the chairmanship of the President of the Royal College of Surgeons, between four representatives each of the Faculty, the Ophthalmic Group Committee of the B.M.A., and the Association of British Ophthalmologists, for May 8, and the results of its deliberations will be published in due course.

At its first meeting the Council elected Standing Committees on medico-politics, education and research, and remuneration and emoluments.

H.M. Forces Appointments

ROYAL ARMY MEDICAL CORPS

The following officers holding Short Service Commissions have been appointed to permanent commissions: Capts. J. B. Neal, E. G. Wright, R. L. Marks, J. B. Evans, H. M. Rice, C. E. Stuart, P. H. Shorthouse, M. M. Lewis, P. C. Mitchell, R. M. Johnstone, T. P. H. McKelvey, W. R. W. West-Watson, J. M. Matheson, H. R. Miller, J. W. Spence, S. Boan, W. M. Owen, G. L. Ritchie, J. N. Hamill, C. Reburn, R. K. Pilcher, H. Pozner, G. F. Anderson, R. H. Baird, H. R. Hartnell, H. W. Whitcher, A. C. S. Hobson, J. G. S. Holman, S. J. Hepworth, L. Griffiths, C. F. Murison, R. I. Mitchell, D. B. Seymour-Price, R. J. Gray, S. Mackenzie, H. G. Skinner, J. P. Baird, T. A. Groves, E. L. O. Hood, S. M. P. Conway, and R. Paul.

Short Service Commission.—Lieut. (War Subs. Capt.) R. Waddell, and War Subs. Capt. A. C. S. Hobson, M.C., from Emergency Commissions, to be Lieuts., and to be Capts.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Senior Training Corps.—Lieuts. J. Secker and J. Short, supernumerary for service with Durham Univ. Senior Training Corps, have resigned their commissions.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. J. J. Geany has relinquished his commission on account of disability, and has been granted the honorary rank of Capt. (Substituted for the notification in a *Supplement* to the *London Gazette* dated March 13.)

War Subs. Capt. S. F. Smith has relinquished his commission on account of disability, and has been granted the honorary rank of Capt.

To be Lieuts.: C. J. See, J. A. Kay, and G. E. Phillips.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

(Mrs.) Jessie A. T. Henry to be Lieut.

ROYAL AIR FORCE

Gp. Capt. (Temp. Air Cdre.) R. W. Ryan has retired at his own request, retaining the rank of Air Cdre.

ROYAL AIR FORCE VOLUNTEER RESERVE

Fl. Lieut. J. F. Cooper has relinquished his commission on account of medical unfitness fo Air Force service, retaining the rank of Squad. Ldr.

Fl. Lieut. (Temp. Squad. Ldr.) T. C. Wilson has resigned his commission, retaining the rank of Squad. Ldr.

Fl. Lieut. J. N. N. Robinson has resigned his commission, retaining his rank.

Flying Officers J. M. T. Adamson, J. A. Fewings, R. S. Hamilton, M. Harty, G. A. N. Horton, C. W. L. Lloyd, and G. H. M. Thornton to be War Subs. Fl. Lieuts.

INDIAN MEDICAL SERVICE

Lieut.-Col. H. J. Rice, C.I.E., M.C., has retire on account of ill-health, and has been grante the honorary rank of Col.

The notification relating to the retirement o Lieut.-Col. E. W. O'G. Kirwan, C.I.E., in the *London Gazette* of Feb. 2 has been cancelled.

EMERGENCY COMMISSIONS

Capt. D. Robertson to be Major.
Lieut. A. B. Philip to be Capt.

WEEKLY POSTGRADUATE DIARY

GLASGOW UNIVERSITY: DEPARTMENT OF OPHTHALMOLOGY.—*Wed.*, 8 p.m., Mr. J. S. Tough: Plastic Surgery of the Eyelids.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF PHYSICIANS OF LONDON, Pall Mall East, S.W.—*Tues.* and *Thurs.*, 4.30 p.m., Croonian Lectures by Surg. Capt. Macdonald Critchley: Problems of Naval Warfare under Climatic Extremes.

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—Arris and Gale Lectures. *Mon.*, 4 p.m., Prof. F. Davies: The Early Development of the Human Embryo. *Wed.*, 4 p.m., Dr. D. V. Davies: The Synovial Membrane and the Synovial Fluid of Joints. *Fri.*, 4 p.m., Mr. Judson T. Chesterman: Some Alterations of the Neuromuscular Balance of the Intestine and their Clinical Significance. *Thurs.*, 4 p.m., Hunterian Lecture by Prof. R. Watson-Jones: Limb and Spine Injuries due to Flying Accidents.

ROYAL SOCIETY OF MEDICINE.—*Tues.*, 5 p.m., Section of Psychiatry. *Wed.*, 5 p.m., Section of Surgery.

CHADWICK TRUST.—At Royal Society of Tropical Medicine and Hygiene, 26, Portland Place, W. *Tues.*, 2.30 p.m., Mr. Eardley Holland: On the Importance of a Maternity Service in the Lif of the Nation.

ROYAL INSTITUTION, 21, Albemarle Street, W.—*Fri.*, 5 p.m., Sir Lawrence Bragg, F.R.S.: *X*-ra Analysis: Past, Present and Future.

B.M.A.: Branch and Division Meetings t be Held

LEIGH DIVISION.—At Boar's Head Hotel, Leigh Tues., May 8, 8.15 p.m. Agenda: Address b Miss E. M. Mills, F.R.C.S.: Female Sex Hormon Therapy in General Practice, etc. All medical me in the area of the Division are invited.

BIRTHS, MARRIAGES, & DEATH

The charge for an insertion under this head i 10s. 6d. for 18 words or less. Extra words 3s. 6d for each six or less. Payment should be forwarde with the notice, authenticated by the name an permanent address of the sender, and should reac the Advertisement Manager not later than first pos ***Monday morning.***

BIRTHS

ARTHURS.—On April 21, 1945, at Liverpoo Maternity Hospital, to Maureen (*née* Roche) wife of Surg. Lieut. G. Arthurs, R.N.V.R., daughter.

CATTO.—On April 24, 1945, at Rubislaw Nursin Home, Aberdeen, to Doe (*née* Spiby), wife o Capt. W. Dawson Catto, R.A.M.C.: a son.

MANDEL.—On April 27, 1945, at Guy's Hospita to Betty Joyce, wife of Dr. Sydney Mande a son (Morris Emeny).

MARRIAGE

MURRAY—SPENCER-SMITH.—On April 9, 1945, Aldershot, Robert G. Murray, Captain, R.A.M.C to Patricia Spencer-Smith, Q.A.I.M.N.S. (R)

DEATHS

PINHEY.—On April 23, 1945, after a short illne borne with great courage, Eustace Townl Pinhey, O.B.E., M.B., Ch.M., Medical Superi tendent of St. Pancras Hospital, and formerl of St. Clement's Hospital, beloved husband Free, of 96, Stansted Road, Bishops Stortfor Australian journals please copy.

ROSENKRANZ.—On April 6, 1945, at 87, Watfo Way, Hendon, Katharina Rosenkranz, M.D D.M.R.E., after long illness bravely borne.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY MAY 12 1945

British Medical Association

ANNUAL REPORT OF COUNCIL, 1944-5

Every member is asked to keep this Supplement, which contains matters referred to Divisions, until the subjects have been discussed by his Division.

PRELIMINARY

1. Again the membership of the Association shows a very satisfactory increase. The present figure is 49,323, representing a net increase of 3,186 during the year. Since 1939 the Association's membership has increased by 10,000.

The Roll of Honour includes the names of 52 medical officers killed on active service; 29 who have died on active service; and 4 civilian members killed by enemy action. In addition the Association has to deplore the loss by death of 502 members.

Dr. H. Guy Dain, Birmingham, has been re-elected Chairman of Council until the termination of the Annual Representative Meeting, 1946.

President of the Association

2. The Association deeply deplores the loss of its President, Viscount Dawson of Penn. Lord Dawson, who was President at the Association's Centenary in 1932, and was recalled to office in 1943, rendered outstanding service to his profession and to the Association throughout his long and distinguished career.

Under the by-laws, on the death of the President the duties of the office devolve upon the Immediate Past-President. Owing to the death of Sir Beckwith Whitehouse, there is no Immediate Past-President. Under the power conferred upon it under By-law 72 (2), the Council appointed Mr. H. S. Souttar as President of the Association until the next Annual Representative Meeting.

The Council recommends:

RECOMMENDATION.—That Mr. H. S. Souttar, C.B.E., D.M., M.Ch., F.R.C.S., F.R.A.C.S., be elected President of the Association, 1945–6.

Election of a Woman Member to the Council

3. The A.R.M., 1944, amended the by-laws to permit election to the Council of a woman member by women members of the Association. The first woman to be elected in this capacity is Dr. Janet K. Aitken (London).

Annual Representative Meeting

4. The Council has decided to hold the Annual Representative Meeting on Tuesday, July 24, 1945, at 2.0 p.m. The meeting will continue on Wednesday and Thursday, July 25 and 26, and, if necessary, on the following day.

International Relations

5. The A.R.M., 1944, referred to the Council for consideration a proposal that a Foreign Relations Committee should be created as one of the Standing Committees of the B.M.A. As a preliminary step the Council has appointed a small committee for the purpose of exploring the ways and means of promoting closer relationships between the B.M.A. and the organized medical profession in other countries. This committee is arranging a conference with medical representatives of Allied countries to discuss the subject.

Restoration and Development Fund of the R.C.S.

6. The Council has contributed 1,000 guineas to the Restoration and Development Fund of the Royal College of Surgeons.

Board of Registration of Medical Auxiliaries

7. The Council has expressed the view that the time has arrived for the Government to recognize the Board of Registration of Medical Auxiliaries as an approved body for the registration of medical auxiliaries in connexion with any comprehensive medical service.

Charter for Health

8. In the report of Council on the White Paper, published in the *Journal* of May 13, 1944, it was stated:

> "Health is not mainly a question of medical services. The public must not be misled into believing that good health depends chiefly upon hospitals or clinics or doctors, or bottles of medicine, or indeed upon organization. Among the principal factors which determine a people's health are sanitation, provision of public water, housing, nutrition, conditions in factory and office, facilities for recreation, and education."

It seemed to the Council that a comprehensive statement of the profession's views on the basic principles of health would be useful during the coming months of negotiation on a National Health Service. It therefore appointed an influential committee under the chairmanship of Sir John Boyd Orr to prepare an authoritative statement that could be termed "A Charter for Health." The central doctrine is that national policy should be directed towards the satisfaction of human needs and the promotion of human welfare, and the charter discusses various aspects of personal health. It is proposed to publish the charter in book form as early as possible.

Medical Schools

9. In 1943 the Association gave evidence to the Interdepartmental Committee on Medical Schools (the Goodenough Committee) on specific topics indicated by the Committee. The report of the Committee was published in July, 1944, and the Council was gratified to note that the Association's evidence had been substantially accepted. The report, however, covered a wider field than the Association's evidence, and the Council appointed a special committee to examine the Goodenough report and make recommendations. This special committee, under the chairmanship of Mr. Zachary Cope, has made a number of observations which the Council is submitting to the Ministry of Health.

During the course of the discussions on the Goodenough report it became evident that the medical curriculum is in urgent need of revision. It has become overloaded and ill balanced, and the student is burdened with a mass of unnecessary detail. Yet there seems to be a general unwillingness in the several departments of medicine concerned to initiate any reduction or modification in any subject. The Council has therefore appointed a small committee to review the Association's Report on Medical Education, 1934, in the light of later developments and the requirements of modern medicine.

The Future of Psychiatry

10. The Psychological Medicine Group Committee of the Association has co-operated with a Committee of the Royal College of Physicians and the Royal Medico-Psychological Association in the preparation of a Memorandum on the Future Organization of the Psychiatric Services. The memorandum is being submitted to the Negotiating Committee to assist the negotiations on a National Health Service so far as they relate to the mental health services.

Public Relations

11. During the year activities in the field of public relations have increased and developed. The services of the Public Relations Adviser are retained and contacts with Parliament and the Press have been increased in number and extended in scope. Many private interviews with editors and proprietors have taken place with results which are not always immediately apparent. A steady flow of material has passed to the Press. All available means of informing the public on medical matters are being used. Public meetings in different parts of the country have been addressed by the Chairman and members of Council, the Secretary, and other officials of the Association. Divisions are kept supplied with literature and suggestions for local publicity, and are encouraged to participate in local meetings,

debates, and discussion groups, and to keep in close touch with their Members of Parliament. An increasing number of requests for information and literature is received at Headquarters from laymen, including education officers in the Services, in connexion with discussions and lectures on post-war medical services.

Two Public Relations Conferences have been held, one in London and one in Leeds, to which Divisions in the surrounding districts were invited to send representatives. Each conference was addressed by a well-known public relations consultant and by well-known newspaper editors.

A pamphlet on the policy of the Association as determined by the A.R.M. in December, 1944, has been printed, and work is proceeding on other publications in book or pamphlet form. A short film depicting the work of the family doctor is under production. The services of a medical journalist have been engaged, and articles written by him have been published in national and local newspapers.

GENERAL PRACTICE

Post-war Financial Aid

12. The Council has examined the various schemes for the financial assistance of doctors in the purchase of practices, with special reference to the problem of younger Service doctors entering medical practice after the war. The Council recognizes that the average age of many entrants into general practice will be higher, and that high rates of taxation, which may well be expected after the war, will make it more difficult to repay a loan.

The existing financial and credit services to general practitioners fall short of what is required, and it has been the object of the Council to devise a scheme to enable a doctor without capital to purchase a practice and at the same time to retain, after the discharge of his commitments, a net income sufficient to maintain a reasonable standard of living. As a result of its discussions the Council has secured substantial concessions in the conditions under which loans are made for buying practices, with interest rates much lower than those now in operation. The Council hopes shortly to be in a position to publish a factual statement of the available schemes.

Certification

13. The Council has considered the following Minute 265 of the A.R.M., 1944:

> 265. Resolved: That the policy of this Association be to lessen the burden of certification, and, with this end in view, when a medical certificate is compulsory, to place the responsibility for payment on the authority demanding the certificate.

The suggestion embodied in this minute that where a certificate is compulsory the responsibility for payment of the fee should rest with the authority demanding the certificate appears to the Council to raise issues to which sufficient attention had not been given before the resolution was adopted. The Association has agreed in a limited number of cases—e.g., in respect of the completion of a form for the Ministry of Pensions to determine a pensions issue—that the responsibility for payment of the fee for the certificate should rest with the authority demanding the certificate. But to extend this arrangement to every "compulsory" certificate appears to the Council to be a far-reaching proposal. The resolution is doubtless intended to cover certificates of incapacity for work. If, in such cases, the employer is to be responsible for the doctor's fee for the certificate this might well be held to imply that the practitioner's obligation is to the employer and not primarily to his patient. In short, it is introducing a third party into the doctor–patient relationship. The Council holds that, in general, where the patient is required to produce evidence of incapacity he should be responsible for payment of the fee for the necessary certificate, and that it is undesirable that the Association should adopt any policy which might tend to weaken this position. Departure from this principle should be approved in exceptional cases only. Minute 265 of the A.R.M. carried to its logical conclusion would mean that only in exceptional cases would the patient pay a fee for a medical certificate; the acceptance by the Association of this principle is regarded by the Council as undesirable.

On the grounds stated the Council regards the proposal contained in Minute 265 as both impracticable and impolitic.

RECOMMENDATION.—That Minute 265 of the A.R.M., 1944, be rescinded.

Capitation Fee for Ex-regular Firemen

14. After protracted negotiations with the Fire Service Department of the Home Office, the Council has been able to secure a more satisfactory scale of fees for the treatment of ex-regular firemen. In 1942 the Department paid a capitation fee of 12s. 6d. for the treatment of ex-regular firemen irrespective of their income. The A.R.M. of that year expressed dissatisfaction with these arrangements. As a result of negotiations the following scale has now been agreed:

1. For treatment of firemen with incomes up to £420 per annum—a capitation fee of 13s. 6d.

2. For treatment of firemen with incomes above £420 per annum, the following itemized scale:

5s. 0d. for attendance at surgery	inclusive of medicine.
7s. 6d for visit	
15s. 0d. for night visit	

3. For firemen in need of attention, temporarily drafted away from home town, where the income does not exceed £420 per annum—3s. 6d. a visit, maximum 14s. a quarter.

4. Mileage in addition for distances above two miles (instead of three miles as at present): this to be regarded as a wartime measure.

Fees paid by Ministry of Pensions for Sessional Work

15. The Council has secured an improved scale of fees for sessional work under the Ministry of Pensions. The new rates, which became effective on Jan. 1, 1945, are as follows:

No. of Sessions per Week	Ordinary Members			Chairmen			Specialists		
	£	s.	d.	£	s.	d.	£	s.	d.
1. Up to and including five	2	2	0	2	12	6	3	5	0
Thereafter..	1	11	6	2	2	0	2	12	6

2. Where it is not possible to assemble a sufficient number of cases to occupy a specialist for a full session, or when the examination is carried out at the specialist's own residence, the specialist fee will be:

For one case only	£2	2	0
For two cases only ..	£2	15	0
For more than two cases ..	£3	5	0

Fees for Medical Witnesses

16. The Council is reopening discussions with the Home Office with a view to securing a new scale of fees for medical witnesses in both civil and criminal cases. The Scottish Committee is taking corresponding action in Scotland.

Certification in the North of England Branch Area

17. The Council has considered representations by the North of England Branch on the question of certification. The Branch has urged that the principle of certification should be investigated on a national basis, and that efforts should be made to bring about uniformity of action in charging for certificates. The Branch has urged particularly the replacement of Form E.D. 652 by another form, and that certificates for short-period incapacity should be discontinued.

The Council is not unmindful of the heavy burden which rests upon general practitioners in the matter of certification, but it does not agree with the Branch's suggestion that efforts should be made by the Association to bring about nation-wide uniformity of charges for medical certificates for incapacity for work. With the single exception of Form E.D. 652 it has been the deliberate policy of the Association not to make any recommendation to doctors as to the fee they should charge for such certificates. The Council is satisfied that this is a sound policy, as conditions of practice vary so much, and individual practitioners prefer to charge a fee for certificates which they regard as appropriate.

Concerning Form E.D. 652, the Council is satisfied that this form, which is widely used, is well designed for the purpose for which it was intended. The Council does not propose any modification of it. With regard to certificates for short-period incapacity, the proposal that these should be discontinued raises wide issues involving both employee and employer. The Council does not therefore propose to take any action. Upon the whole of the matters raised the Branch has full discretionary powers to make recommendations to the general practitioners in its area.

Occasional Attendance on Service Personnel and Italian P.O.W.

18. In the Council's opinion the scale of fees laid down for occasional attendance on Service personnel and Italian prisoners of war is inadequate. Discussions have been opened with the War Office and other Service Departments with a view to securing an increase in these.

Doctors' Cars

19. The Council has considered the serious situation arising from the difficulty of replacing worn-out cars, and this matter has been the subject of frank discussion with representatives of the Ministry of War Transport. No new cars are at present being issued for civilian users, but the Ministry has given an assurance that as soon as new cars are available the Association will be informed of the steps necessary to obtain priority delivery.

From time to time a limited number of cars which are surplus to Service requirements are available. These, after being reconditioned, may be made available to those whose claims for priority are accepted, at prices which are not unreasonable compared with those obtaining in the "used-car" market. The demand for these cars is likely to be greater than the supply, but the Ministry is willing to give a high degree of priority to doctors.

Election of Direct Representatives on the G.M.C.

20. It is possible that there will be an election for five Direct Representatives to the General Medical Council in the early part of 1946. It is the policy of the Association to select candidates for election by the general body of the profession and to use the machinery of the Association to secure the election of the selected candidates. The Council will take appropriate steps before the Annual Representative Meeting to invite nominations from the Divisions, and during the course of the A.R.M. five candidates to whom the support of the Association should be given in the G.M.C. election will be selected.

NATIONAL HEALTH INSURANCE

Standards of Payment for G.P.s

21. After consultation with the Association, the Minister of Health and the Secretary of State for Scotland have appointed an Interdepartmental Committee to recommend "what ought to be the range of total professional income of a registered medical practitioner in any publicly organized service of general medical practice." The committee consists of an independent chairman (Sir Will Spens, Master of Corpus Christi College, Cambridge), a Treasury representative, a solicitor, an accountant, a trade union official, and four general practitioners nominated by the B.M.A. The Association will give evidence before the committee, and this evidence is now being prepared. The committees responsible for the preparation of the Association's evidence will have in mind the view expressed at the 1944 A.R.M. that the present N.H.I. capitation fee is inadequate.

Sickness Benefit in Pregnancy

22. The Ministry of Health has been requested to take whatever action may be necessary to implement the view expressed at the A.R.M., 1944, that ample provision should be made to render it unnecessary for any woman to continue in remunerative work during the last six weeks of pregnancy and for the seven weeks following her confinement, and that independent medical opinion and examination within eight weeks of the expected date of delivery should be conducted at home.

Title to Medical Benefit

23. Among questions that are being discussed with representatives of the Ministry of Health is the view of the A.R.M., 1944, that responsibility for the investigation of cases of doubtful title to medical benefit should rest with insurance committees and approved societies, and not with the patient's doctor.

PUBLIC HEALTH

Askwith Memorandum

24. The Askwith Memorandum was agreed to at conferences held at the Ministry of Health in 1929 under the chairmanship of Lord Askwith, at which representatives of the County Councils Association, the Association of Municipal Corporations, the Urban District Councils Association, the Rural District Councils Association, the London County Council, the Association of Education Committees, the Mental Hospitals Association, the Metropolitan Boroughs Standing Joint Committee, and the British Medical Association were present. The agreed recommendations set out in the Memorandum were approved by the A.R.M. in 1929 (Minute 73), and were ratified by the associations of local authorities with the exception of the County Councils Association, although the individual county councils have since accepted the scale. The duration of the agreement is governed by Section XI of the Memorandum, namely:

> "This Agreement shall come into force on April 1, 1930, hereinbefore referred to as the 'appointed day'; and remain in force for five years and thereafter from year to year, subject to notice of one year from any of the bodies mentioned in paragraph (5) of Section X."
>
> (*Note:* The bodies mentioned in paragraph (5) of Section X are those named in the paragraph above.)

The Council has considered recommendations from the Society of Medical Officers of Health, the Royal Medico-Psychological Association, local Divisions of the Association, and medical officers in various branches of the public health service urging the Association to seek a revision of the present scales. It has been represented to the committee:

(1) That proposals for increases in salaries of medical officers to bring them into conformity with increases granted in recent years to other local authority officers have been rejected by local authorities on the grounds that the medical officers' salaries are in accord with the Askwith Memorandum.

(2) That since the adoption of the Rushcliffe salary scales for nursing staffs there is disproportion between the salaries of senior nurses and those of assistant medical officers of health and resident medical officers in municipal hospitals.

The Council has given the appropriate bodies the prescribed period of one year's notice as from April 1, 1945, of its intention to terminate the Askwith Agreement on March 31, 1946. The Council is seeking the observations of the Society of Medical Officers of Health on the question whether negotiations for future scales for the Public Health Service should be conducted on the same basis as those preceding the Askwith Memorandum—i.e., with representatives of local authorities and an independent chairman—or whether such negotiations should form part of the general negotiations between the Ministry of Health and the medical profession on the terms and conditions of service in the proposed new medical service.

Education Act, 1944

25. Section 48 (3) of the Education Act which was passed in August, 1944, imposed on local education authorities as from April 1, 1945, the duty of securing that comprehensive facilities for free medical treatment are available to school-children and pupils attending county colleges. "Medical treatment" as defined by the Act does not include treatment in the pupil's home except where the authority is providing education at home.

In March, 1945, the Ministry of Education issued a circular for the guidance of local education authorities in implementing their duties under the Act. The circular recommended that they should take such steps as were practicable in present circumstances and with their existing staff to develop their school clinic services and to make increased provision for hospital treatment. The circular also recommends that in rural areas

> "where frequent visits by the authorities' medical officers may be difficult to arrange and where clinic facilities have not been developed . . . authorities might, where necessary, arrange with local general practitioners for the treatment of pupils referred to them by their medical officers or nurses. Such treatment might be given either in the schools or other suitable places or in the doctor's own surgery. Payment for the treatment should be agreed between the authority and the practitioner on a suitable basis."

The Council has made written representations on the following points:

(1) To the extent to which medical care additional to that now available is intended, there arises the problem of additional medical, nursing, and other personnel. The plain fact is that additional doctors are not available. Over one-third of the medical profession is serving in His Majesty's Forces, and the Central Medical War Committee is experiencing grave difficulty in satisfying even the minimum needs of the Services without causing a serious deterioration in the medical facilities available for the civilian population. It is impossible at the present time to extend existing facilities without reducing recruitment to the medical services of the armed Forces below a level consistent with Service efficiency.

(2) By advising that in urban areas the form of development should be an elaboration of school clinic and allied services, a procedure is suggested which, even where it does not involve additional personnel, is open to the criticism that it may prejudice the initiation and development of a comprehensive medical service. The treatment provision for children under a comprehensive scheme will not be based upon a school clinic service. To advise development on these lines now may obstruct future development on lines acceptable to the Minister of Health and to the medical profession.

(3) For these reasons the Minister is urged, in order that local authorities may not continue to have imposed upon them duties they cannot carry out and in order that the public shall not be promised something which is unattainable at the present time, to take steps to reconcile the legal position with the hard facts.

26. The Minister has agreed to receive a deputation from the Association, and when the results of these representations are known a communication will be sent to the Divisions. If the Minister is unwilling to take steps to secure the postponement of the operation of Section 48 (3) he will be urged to advise local authorities to utilize existing general practitioner and consultant services, depleted though they are, for the purposes of the proposed extensions.

The Council has expressed the following views on the terms appropriate for this work:

(1) That for services provided for children covered by the Act, both by consultants and by general practitioners, payment should be made on an item of service basis, and that there should be no contract between the individual practitioners and the local authorities.

(2) That for the purposes of the arrangements to be made under Section 48 (3), the reference of patients to the practitioner should not ordinarily be by an officer of the local authority, but through the parent or guardian, provided that the school medical officer should not be precluded from referring children found needing medical care at the routine inspections to a medical practitioner at hospital, clinic, or surgery. The local authority should accept responsibility for payment of the practitioner's fee.

(3) That the fee for a general practitioner service for attendance at the

doctor's surgery should be not less than 5s., including medicine; and that the existing practices for payment for emergency attendance at schools should be preserved where these are satisfactory.

Local Government in England and Wales

27. The Council has considered the Ministry of Health White Paper on local government in England and Wales during the period of reconstruction. From the point of view of public health administration the Council regards the Government's proposals as a meagre contribution towards the solution of local government problems.

Institutional Accommodation for Tuberculosis

28. The Council has made representations to the Ministry of Health that the provision of institutional accommodation for tuberculosis should receive high priority as part of a comprehensive hospital service for the nation in the development of the Government's building programme.

Milk

29. Representations have been made to the Council expressing concern that there is no power to stop the sale of milk for human consumption which has been found to contain tubercle bacilli until the infected cow is discovered. The Council has brought this matter to the notice of the Ministry of Health and the Ministry of Food, and has urged that legislation should be introduced requiring milk for human consumption to be pasteurized.

Shortage of Trained Midwives in Hospitals

30. The Council has made representations to the Ministry of Health that in view of the present serious shortage of midwifery personnel every possible step should be taken to ensure that the available services of trained nurses with midwifery qualifications and midwives are used to the best advantage.

Payment of Part-time Medical Officers

31. In July, 1944, a conference was held at the Ministry of Health between representatives of the Ministry, the Association, and the associations of local authorities to consider the B.M.A.'s recommendation that, as a wartime measure, the remuneration of doctors employed in a part-time capacity by local authorities should be increased by 20%. The local authority representatives who attended the conference agreed to recommend to their constituent bodies that where a war bonus is given by a local authority to its whole-time officers a proportionate bonus should be paid to its part-time officers. It is understood that the recommendation of the local authority representatives has been accepted by the local government associations and by the L.C.C.

The Minister of Health has issued an order increasing by 20% the minimum fees payable to public vaccinators under the Vaccination Order, 1930. As regards fees payable to doctors called in by midwives, the Minister states: "These fees were fixed as recently as 1940, and it does not appear to the Minister necessary to amend the scale pending arrangements to be made in connexion with the new health service."

The Council is dissatisfied with the results of the conference with local authority associations.

A National Maternity Service

32. The Council has considered the report on a National Maternity Service prepared by the Royal College of Obstetricians and Gynaecologists. It will be recalled that the Association in 1929 and 1935 prepared a report on a National Maternity Scheme for England and Wales. The problem was dealt with in the Association's proposals for a General Medical Service for the Nation published in 1938. The report of the College includes a proviso that the general practitioner who desires to undertake midwifery *must* have special experience in order to take his place in the service in domiciliary midwifery, at an ante-natal clinic, or in advising during the post-natal period. It is this recommendation which is in direct conflict with the policy of the Association as set out in the report on a General Medical Service for the Nation as follows:

> "In the view of the Association, what is needed in the interest of the mother is the establishment of a national maternity service based upon the principle of continuity of medical and nursing care throughout pregnancy, labour, and the puerperium. The present system, under which it is frequently the case that a woman receives her antenatal care at the hands of one practitioner, is confined by a midwife, and, in the event of an emergency arising, is then attended by a practitioner who is without previous personal knowledge of the woman's pregnancy, should be replaced by one in which every woman is, throughout pregnancy, labour, and puerperium, under the care of her doctor and midwife, aided when necessary by a specialist and institutional service."

There are other parts of the report of the College with which the Council is not in agreement, and the Council is seeking an early opportunity of discussing the whole matter with the Royal College of Obstetricians and Gynaecologists.

Equal Pay

33. The Association was invited to submit evidence in relation to the medical profession to the Royal Commission on Equal Pay. The principle of equal pay for men and women practitioners was adopted by the Association as part of its policy many years ago, and it is generally operative in all branches of medical practice. A memorandum of evidence on the Association's experience was submitted to the Royal Commission. Attention was, however, drawn to the restriction of opportunities for women among the senior medical appointments in the public services. On the question of inequality in the matter of cost-of-living bonus the Association's evidence states:

> "Although local authorities and Government Departments pay medical women equal salaries and emoluments for equal work, they illogically discriminate between them in the cost-of-living bonus, the amount being 23s. per week for men and 18s. 6d. per week for women on salaries up to £1,500 (new scale of figures, Nov. 1, 1944). Though the Association realizes that the Commission is not primarily concerned with this matter, it is felt that such differentiation regardless of responsibility for dependants is an anomaly requiring consideration."

Owing to the paper shortage it has not been possible to print the whole of the memorandum in this report, but copies will be sent to any members applying to the Secretary.

SPECIAL PRACTICE

A National Eye Service

34. The Ophthalmic Group of the Association has prepared a scheme for a national medical eye service which, it is hoped, will take its place in the post-war National Health Service. The scheme has been carefully considered at two series of Regional meetings of the Group, at which all who practise ophthalmology, whole- or part-time, have had opportunities of expressing their views on the important matters of principle involved in it. The Council submits the scheme for the approval of the Representative Body. (See Appendix.)

RECOMMENDATION.—That the Representative Body approves the scheme for a National Eye Service.

HOSPITALS

Use of Hospital Beds by General Practitioners

35. In accordance with Minutes 288–290 of the A.R.M., 1944, the Council has under consideration the question of the preservation and development of the small general hospitals with a view to making these hospitals, staffed by general practitioners, the nuclei of one type of the future health service centres. A report on this subject will be made later.

Appointment of Medical Staffs of Hospitals

36. The Council has had under consideration the question of permanent appointments in wartime, and has decided to repeat its 1939 recommendation to all hospital authorities that appointments to the consultant and specialist staffs should be made on a temporary basis during the war and for one year thereafter. The Council has recommended also that, if there are very exceptional circumstances which are held to justify a permanent appointment, a period of at least four months should, whenever possible, be allowed for the receipt of applications to permit of candidates serving over-seas being considered.

Liaison between B.H.A. and B.M.A.

37. There has been a continued exchange of views with the British Hospitals Association on the White Paper in so far as it relates to voluntary hospitals. The chairman of the Hospitals Committee and the Secretary of the Association have been appointed members of the British Hospitals Association Deputation Committee which is discussing with the Minister the White Paper proposals.

FINANCE

38. It had been confidently expected that the income in the financial year ending Dec. 31, 1944, would be adequate to meet the growing expenditure of the Association, and the accounts prepared for the year show that this confidence was justified. Post-war plans, however, commit the Association to heavy expenditure, and the substantial surplus disclosed in the accounts of recent years should not be expected to continue.

Balance Sheet

39. The total liabilities diminished, as every opportunity was taken to meet accounts as they were presented. Substantial additions have again been made to the reserve funds; accruing surplus moneys have been invested in order to

provide cover for these funds. The following summarized balance sheet shows the general position:

	£
Sundry creditors	13,135
Reserve funds	170,664
Secured loans	7,100
Accumulated surplus	329,201
	£520,100
Sundry debtors	18,034
Leasehold premises	379,206
Investments and cash	112,897
Paper, stocks and fixtures	9,963
	£520,100

Income and Expenditure Account

40. At the close of 1944 the membership stood at a new record of 48,230 and for the first time the revenue from subscriptions exceeded £100,000. There was an increase in the number of members taking advantage of the Service subscription. As a result of the different rates paid by members, the average subscription received for the year was £2 4s. 6d. Rents collected from tenants in the Association's building exceeded £20,000. When the South Wing is completed the income from this source will be increased, but it is evident that the growing activities of the Association will necessitate increased accommodation with a consequent diminution in the rentals received.

Capitation grants paid to Branches would, in the ordinary course of events, increase in proportion to the rise in membership. Medical men and women serving with the Forces, however, form a considerable proportion of the new members, and for official purposes these are regarded as unattached to an organized Branch and no grant is payable in these circumstances.

There was little variation in the normal recurring items included in the Association general expenses, apart from an increase in Schedule D income tax, which was complementary to the increase in the revenue from investments. The Association, however, was involved in substantial expenditure by the issue to the whole of the profession of the White Paper and Questionary on the National Health Service, and the fees paid to the British Institute of Public Opinion for the analysis. The proportion of the Public Relations expenses borne by the Association increased during the year within the limit approved by the Council. The premises expenses increased slightly over the preceding year, although it was not possible to maintain a high standard of cleaning and repair throughout the building. Every opportunity, however, is taken to obtain licences to carry out urgent repair and decoration. The cost of printing, postage, and stationery increased during the year as a natural result of the development of the work of the Association in all departments.

The Balance Sheet and the Income and Expenditure Account will be published in a later issue of the *Supplement*.

Journal Account

41. The cost of producing the *Journal* materially increased during 1944. As a result of the growing membership, it was necessary substantially to increase the number of copies printed, the number rising from 2,392,050 in 1943 to 2,658,850 in 1944. Although the supply of paper made available was again strictly controlled, the number of pages produced during the year increased from 3,034 in 1943 to 3,260. The number of advertisement pages diminished from 1,144 to 1,129, but it is highly satisfactory to note an increase in advertisement revenue.

The accounts of the scientific journals include for the first time the *Annals of the Rheumatic Diseases*, recently taken over by the Association. In all cases the number of subscribers to these journals was increased in 1944.

Office Staff Superannuation Fund and Trust Funds

42. The quinquennial revaluation of the Office Staff Superannuation Fund has been made by the actuary and discloses that the financial position is highly satisfactory. None of the Prize Funds has made awards during the year. The amount of subscriptions and donations collected by the B.M.A. Charities Trust Fund shows a satisfactory increase.

Estimate for 1945

43. From figures already available it is estimated that the revenue of the Association during the coming year will meet the expenditure, even though this will be on a higher scale than in recent years. With an increase in revenue from subscriptions, it is likely that the total receipts for the year will be approximately £134,000.

BRITISH MEDICAL JOURNAL

44. The *British Medical Journal* has continued to appear regularly notwithstanding the difficulties of production and distribution in wartime, with severe rationing of paper and shortage of staff.

Since last year's report under this heading the obligatory circulation of the *Journal* has grown month by month in consequence of the large increase in membership of the Association, and the weekly printing order now approaches 53,000 copies. If that figure is not exceeded it may be possible with the present ration of paper to continue producing a *Journal* with an over-all size of 60 pages, and sometimes 64, compared with an average weekly total of 144 pages in the year 1938. Every means for economizing space has long since been adopted. From the early part of 1942 circulation outside the membership has been curtailed drastically, and new subscriptions are declined so long as the paper situation remains acute. The number of original articles and medical memoranda submitted for publication is far in excess of the space available under wartime conditions. Last year 946 signed articles were received in the Editorial Department, compared with 801 in 1943, 797 in 1942, 737 in 1941, and 667 in 1940. The total is now as large as before the war. Nor are there any signs of diminution in the number of letters sent for publication, and it is possible to print in the *Journal* or *Supplement* only a selection from the large volume of correspondence received from members at home and abroad on a great variety of subjects.

Throughout 1944 many additional pages were allocated to the *Supplement* for publication of matter concerning the Government's White Paper, including the Association's Analysis of the Government's Proposals, the Questionary to the Profession, and an abstract of the White Paper in nine parts; also much correspondence and many signed articles and addresses on a National Health Service.

The new feature introduced into the *Journal* early in 1943 under the heading "Any Questions?" has established its popularity with readers and is continued each week in response to a very widespread demand. A first selection of the queries and answers has been prepared for republication in book form, but authority for an allowance of printing paper for this purpose cannot yet be obtained from the Ministry of Supply.

Special Quarterly Journals

45. In spite of printing difficulties and heavy pressure of work on the editors of the special quarterly journals, these have continued to be published throughout the war—though in some instances at irregular intervals—and the Association has even been able to add to its list the *British Journal of Industrial Medicine* and the *Annals of the Rheumatic Diseases*. The former journal is published in conjunction with the Association of Industrial Medical Officers, and the latter with the Empire Rheumatism Council. The high standard set and maintained by the *British Journal of Industrial Medicine* is reflected in a rapidly increasing circulation, which, in fact, doubled itself by the end of the first year of publication. By sacrificing advertisement space and obtaining an increased ration of paper the Association has just been able to meet the demand for this periodical. On the recommendation of the Journal Committee the Council agreed that the Association should publish a *Journal of Social Medicine*, under the editorship of Prof. F. A. E. Crew, F.R.S., assisted by Sir John Orr, F.R.S., and Prof. Lancelot Hogben, F.R.S. The Paper Control unfortunately refused to issue a licence to publish, and the Government's action in refusing to allocate 1 ton of paper a year for this journal was criticized by Lord Buckmaster in a debate in the House of Lords in March. It is presumed that the end of the war will increase the supply of paper and that the *Journal of Social Medicine* will make its appearance next year. After consultation with the British Paediatric Association and the Editorial Committee of the *Archives of Disease in Childhood*, the Association decided to purchase the rights of the *British Journal of Children's Diseases*, which is now incorporated in the *Archives of Disease in Childhood*. The link between the British Paediatric Association and the *Archives* has been formally recognized by arranging that the editors and editorial committee of this quarterly are to be jointly appointed by the B.M.A. and B.P.A.

ORGANIZATION

Regional Organization of the Association

46. The A.R.M., 1943, passed a resolution to the effect that arrangements should be made now to appoint full-time Regional Secretaries so that these secretaries shall start to function as soon as possible after the war. The Council has considered this matter and has decided to appoint full-time regional secretaries as soon as national circumstances permit. It is proposed in the first instance that the regional organization should cover the following regions: I, North-Western, II, North-Eastern, III, Greater London, IV, South-Eastern, V, Wales, including South-Western. The actual areas of the regions and their administrative centres are still under consideration.

Regional Secretaries will be officers of the Council appointed by it and responsible to it; their status will be that of Assistant Secretaries to the Association.

Association Organization in Northern Ireland

47. The Council has considered a proposal made by the Council of the Northern Ireland Branch that a Standing Committee for Northern Ireland should be formed with duties and powers analogous to those of the Scottish Committee.

The chief reason for forming a Standing Committee for Northern Ireland is that there is a separate Government, and if the Northern Ireland Branch is to be recognized as the mouthpiece of the profession in that country it should have a representative committee with a status higher than that of the existing Branch Council. Such a proposal would have the added advantage that the Northern Ireland Branch would have direct access to the Central Council. The Branch Council has consulted the Divisions in Northern Ireland upon this proposal, and a unanimous wish has been expressed that there should be a Standing Committee for Northern Ireland. The project is one with which the Council is in complete sympathy.

The Council accordingly recommends:

RECOMMENDATION.—That the By-laws and the Schedule to the By-laws be altered in the following manner:

By-law 78

Sub-clause (1). By inserting the words "Northern Ireland" before the words "and Dominions."

By substituting the words "Except in the cases of the Insurance Acts, Scottish and Northern Ireland Committees" for the words "Except in the cases of the Insurance Acts Committee and the Scottish Committee.".

Sub-clause (2). By substituting the words "Each of them, the Insurance Acts Committee, the Scottish Committee and the Northern Ireland Committee" for the words "Each of them, the Insurance Acts Committee and the Scottish Committee."

The Schedule to the By-laws

By inserting the following immediately after the item "Naval and Military":

Under the heading "Name of Committee" the words "Northern Ireland."

Under the heading "Additional Members *ex officio*" the words "All the Members of Council who shall for the time being be resident in Northern Ireland."

Under the heading "Appointed Members. Otherwise appointed" the words "Members appointed by the Divisions in Northern Ireland grouped in such manner as shall from time to time be approved by the Council."

Under the heading "Duties, Powers, etc." the words "To consider all matters specially concerning Northern Ireland, and in conformity with the decisions of the Representative Body, deal with all such matters. It shall meet at such place and time as the Committee itself may direct. The Committee shall have power to add to its number not more than 3 Members specially qualified to assist in the business of the Committee."

Association Handbook

48. The Association *Handbook* has not been published since 1938. The Council has decided that as soon as practicable the *Annual Handbook of the B.M.A.* be revised and published, if necessary, in an abbreviated form.

Proposed Standing Industrial Medicine Committee

49. The Council has considered the following Minute of the A.R.M., 1944—

> 257. Proposed by Bromley: That in view of the increasing importance of industrial medicine this meeting recommends to the Council that it should consider the desirability of setting up a separate standing committee of the Association to deal with matters of industrial health.
>
> The motion was accepted by the Chairman of Council as a reference to the Council—

but has deferred consideration of the matter pending the reconstruction of the central committee machinery of the Association.

NAVAL AND MILITARY

Representation of R.A.M.C. and R.A.F.M.S. on the Council

50. RECOMMENDATION.—(*a*) That Major-Gen. R. W. D. Leslie, C.B., O.B.E., be elected to represent the R.A.M.C. on the Council for the period 1945–8.

(*b*) That Air Marshal Sir Victor Richardson, K.B.E., C.B., be elected to represent the medical branch of the R.A.F. on the Council for the period 1945–8.

War Gratuities

51. Dissatisfaction has been expressed by some members of the Association now serving with H.M. Forces with the scale of war gratuities recently announced by the Government. The gratuities to be paid on the termination of hostilities compare unfavourably in amount and in method of calculation with the sums paid at the end of the last war, and the Council is considering what practical steps can be taken in the matter. It will be appreciated that the issue is a general one affecting all branches of the Services. In the meantime, inquiry has been made of the Treasury on the following points:

(1) Will a medical officer who is released at the instigation of the Central Medical War Committee on grounds of civil needs be entitled to either the release leave of 56 days, or to the foreign service leave, or both?

(2) Will a medical officer be entitled to receive, if he so wishes, the outfit allowance of £12 in lieu of the outfit?

Retired Pay of Regular Officers

52. In 1938 the Council submitted to the Service Departments a statement on the inadequacy of the pension rates paid to regular serving officers. The Departments would not agree to revise the existing scale, and the Council decided not to press the matter. The Council is reviewing the matter afresh, and it is expected that renewed representations will be made to the Departments.

Disability Pensions for Medical Officers

53. Representations have been made to the Ministry of Pensions for an improvement in the rates of disability pensions for medical officers. It appears to the Council that the rates are inadequate, particularly in the case of officers in the junior ranks with a degree of disability of 70% and over.

The Ministry of Pensions replied that since the pension rates were reviewed by the Government in 1943 there have been no changes which would justify any further increase in the current rates of disability pension. The Department argued that there are other factors which should be borne in mind. Additional allowances may be payable subject to the fulfilment of certain conditions in respect of a wife and children, and an allowance up to a maximum of £80 a year may be granted towards a child's education. If the officer is in need of constant attendance, an allowance up to £100 a year may be granted. Special provision exists for the officer who is, in fact, virtually unemployable by reason of his pensionable disability. He may be granted a supplement of £26 a year together with an allowance, if necessary, for constant attendance and allowances for his wife and children, even if they would ordinarily be ineligible by reason of the date of marriage or birth.

PATENT LAW

54. The Council set up a Special Committee to prepare and submit evidence on behalf of the Association to the Patents Committee, 1944, appointed by the President of the Board of Trade to consider and report whether any changes are desirable in the Patents and Designs Act. The following memorandum of evidence, which was supported by verbal evidence, was submitted to the Board of Trade Committee.

I. *Endorsement of Medical Patents as Licences of Right*

(1) The committee has reached the conclusion that a system of compulsory licensing for medical patents is not necessary or desirable at the present time and would deprecate the automatic issue of licences as this would remove from the Controller his present power of refusing a licence to a manufacturer lacking the staff and facilities necessary to ensure satisfactory production.

II. *Amendment of Section 38A of Patents and Designs Act, 1907*

(2) The present position is that Section 38A of the Patents and Designs Act, 1907, places on the Controller the onus of granting or refusing an application for a licence to manufacture a food or medicine which is the subject of a patent. The Controller is required to grant a licence to any applicant "unless he sees good reason to the contrary." Any decision by the Controller under Section 38A is subject to appeal to the High Court. As the committee understands it the intention of Section 38A was to enable a licence to be obtained under this Section subject only to the condition that the applicant could show that he was suitably qualified and had appropriate facilities for production. The committee doubts whether Section 38A of the Act makes this position clear and recommends that it should be so amended as to ensure that a licence will be granted under that Section to any applicant who satisfies the two conditions mentioned.

(3) It has been suggested to the committee that foreign patentees enter into agreements with existing British firms or with firms founded in Britain for the purpose, who act as agents for the sale in this country of therapeutic substances and appliances the manufacture of which is carried out almost entirely abroad. Such a procedure results in the foreign firm obtaining a virtual monopoly. We recommend that consideration should be given to such alteration of the law as would provide a remedy for this practice.

III. *Patents and Trade Marks*

(4) It is appreciated that the Committee of the Board of Trade is not dealing directly with trade marks, but this point is one of great importance and inevitably arises when considering the patents question. In certain cases where a patent is in operation there is afforded to the patentee an opportunity of acquiring what amounts to a permanent monopoly by the registration of a trade mark which, by advertisement, he popularizes as the familiar name of the substance or appliance which is the subject of the patent. The committee recommends that a condition in the granting of a patent for a therapeutic invention should be that, if the patentee desires to call the substance or appliance so patented by a term other than its scientific name, he should adopt a name not protected by a trade mark but

approved by a Special Advisory Body nominated for this purpose. The committee is aware that the abuse of trade marks is by no means limited to therapeutic substances or appliances which are the subjects of patents and hopes that the Board of Trade will eventually undertake an inquiry into Trade Mark Law in addition to Patent Law.

IV. *Dedication of Patents to a Central Body*

(5) Arising out of the general and detailed discussion it appears to the committee that it would be advantageous if there could be set up a central body to whom medical patents could be dedicated by a patentee who wishes that his invention should be developed for the benefit of the public.

MEDICAL ETHICS

55. There are no new questions of ethical principle which the Council has occasion to bring to the notice of the Representative Body. The work of investigating complaints regarding professional conduct and advising members of the Association on ethical problems has been continued.

OVERSEA BRANCHES

56. The Council has considered a number of matters submitted by oversea Branches, mainly affecting remuneration and conditions of service in several sections of the Colonial Medical Service. A deputation has met representatives of the Colonial Office to discuss conditions in Malta, Trinidad, British Guiana, Jamaica, and the Windward Islands.

SCOTLAND

57. Dr. A. F. Wilkie Millar and Dr. George MacFeat were reappointed Chairman and Deputy Chairman of the Scottish Committee for Session 1944–5.

Scottish Divisions and Local Panel Committees Conference

58. The Chairman of Council authorized holding a conference of representatives of Scottish Divisions and Local Medical and Panel Committees in Scotland to consider the White Paper on a National Health Service, with particular reference to the section dealing with the service in Scotland, also the report of the Scottish Committee to the Council on the White Paper. This conference took place on October 24, 1944.

Discussions on the White Paper

59. The members of the Negotiating Committee resident in Scotland along with the chairman of the Scottish Committee and a representative of the Highlands and Islands Subcommittee were duly authorized to carry on separate discussions in Scotland with the Secretary of State and the Department of Health on those aspects of the White Paper which peculiarly affected Scotland.

Arising out of those discussions a copy of the proposals relating to the administrative structure of the comprehensive health service in Scotland has been sent to every practitioner in Scotland, also to secretaries of Divisions in non-Scottish areas, for their information.

Liaison with the British Hospitals Association

60. Joint meetings of representatives of the Scottish Branch of the British Hospitals Association and of the Scottish Committee have been held to consider the proposals for the future hospital service in Scotland. Agreement has been reached on all the main issues involved.

Highlands and Islands Medical Service

61. A letter was sent by the Scottish Secretary in October, 1944, to all practitioners taking part in the Highlands and Islands Medical Service, giving full details of the activities of the Highlands and Islands Subcommittee from 1931 till that date. This included particulars of the wartime increases in the grants to practitioners in 1941 and 1943, which were agreed to by the Department of Health as the result of representations made by the Subcommittee.

Maternity Services (Scotland) Act, 1937

62. During 1944 the Scottish Committee continued to make strong representations to the Department of Health on the subject of revision of the terms of service of practitioners under the above Act. In February, 1945, the hon. secretaries of Branches and Divisions and the Secretaries of Panel Committees in Scotland were informed that all the main amendments urged by the Scottish Committee had been agreed to.

These were that the basic fee be increased to £3 3s., with the consequential alterations in the fees payable when a woman changes her residence during her pregnancy, etc. There will be no differentiation in the fees paid for patients entitled to medical benefit under the National Health Insurance Acts, and mileage payments are to be increased as a wartime measure by 10%. This higher mileage grant and the increased fees will be payable in respect of confinements occurring on and after April 1, 1944.

The service has not yet been inaugurated by the local authority in Glasgow. The Glasgow Division and the Scottish Committee have taken action regarding the situation in that city. In Dundee the Division has meantime recommended practitioners not to accept service under the Act.

H. GUY DAIN,
Chairman.

APPENDIX

SCHEME FOR A NATIONAL EYE SERVICE

Preamble

1. The following scheme for a National Eye Service is submitted as a contribution to the discussion of an all-inclusive medical service for the nation. The scheme is based on the assumption that ophthalmology will continue to be an integral and co-equal part of the general plan for the future hospital services of the country. To meet the problem of mass ophthalmic work considerable extension of present facilities will be necessary. This will involve enlargement of hospital departments, the creation of satellite clinics, and the maintenance of any present-day clinics which serve local needs.

2. It is assumed that a national scheme will provide that all eye-examinations and treatment, including the prescription of glasses, will receive attention from qualified ophthalmic medical practitioners with special training and experience. This assumption is made the more readily because of certain official pronouncements which are quoted below.

3. In 1927 a body representing sight-testing opticians promoted a Bill seeking to obtain State recognition of its members. It proposed to restrict the right of prescribing glasses to members of the body concerned, and to oculists. It was strongly opposed by the medical profession on the grounds: (1) that the eye was much more than an optical instrument and that therefore its examination and subsequent treatment, if necessary, was a medical function; and (2) that it was undesirable to combine in one person the professional function of prescribing with the commercial function of selling spectacles. A Departmental Committee was set up to examine the question, and the following are extracts from its majority report:

> "It is generally agreed, however, that in the best interests of the patient the examination of his eyes should, if at all possible, be carried out by an oculist. . . . The oculist can bring to bear the whole of his medical experience either in deciding that it is possible to exclude the existence of disease or in diagnosing and treating any diseased condition should this be present."
>
> "It is common ground that diseases for which the provision of spectacles by themselves affords no relief can exist in the eye itself or can exist in other parts of the body and be detected through the eye, while at the same time an error of refraction may or may not be present. . . . We are satisfied that the cases in which there exist together with refraction error either diseases of the eye or some other disease evidence of which can be detected in the eye are too numerous to be regarded as negligible."
>
> ". . . We are satisfied that the number of cases in which the patient may miss the opportunity of remedial treatment if the case is not handled by an oculist is by no means negligible."
>
> "It seems to us impossible to escape from the conclusion that State recognition of sight-testing or optometry as above defined must carry with it the implication of ability to exclude the possibility of the existence of disease before prescribing glasses."
>
> "In so far as the ability to detect disease would be implied by admission to the Register we feel obliged to say that we are not satisfied that there is any training for opticians sufficiently thorough to avoid the danger which is involved in the possession of a little medical learning. We have heard evidence regarding the curricula of various bodies and we have seen in progress the examination of one of the bodies whose members are qualified for admission to the register of the Joint Council of Qualified Opticians. We have also considered very carefully evidence regarding post-diploma teaching which is given at the 'Refraction Hospital,' but for our present purpose this latter teaching is hardly relevant, since it admittedly applies only to a comparatively small number of opticians who for the most part already hold diplomas."
>
> "We are satisfied, however, that none of the teaching provides anything in the way not merely of general medical training, but of specialized medical training pertaining to the eye which is comparable to the training required of a medical practitioner."
>
> "We have seen that the functions of even the best-qualified opticians should be restricted to the use of mechanical means for the correction of errors of vision, and that in the best interests of the patient the responsibility for any examination of the eyes should be upon an oculist who, in addition to having access to all the resources of the skilled optician, can bring to bear the whole of his medical experience either in deciding that it is possible to determine the absence of disease, or, on the other hand, to recognize and to treat any diseased condition that may be present. Opticians cannot, therefore, provide more than at best a partial service."
>
> "In considering the nature of any possible register for sight-testing opticians we feel bound to pay attention to the effect it might have on the trade of opticians who only dispense prescriptions issued by oculists and abstain from sight-testing. We have been informed that oculists generally test the work of the opticians to whom they recommend their patients to go for the purpose of having spectacles made up, and we are not aware of any demand for a register of

> dispensing opticians by itself. If a register of sight-testing opticians were set up, however, the dispensing opticians would undoubtedly be prejudiced by a lowering of their status in the public estimation, and for this reason, if for no other, we should consider a concurrent register of dispensing opticians necessary."
>
> "While we have been forced to conclude that it is not in the public interest that a State Register of Opticians should be set up, we desire to emphasize that one of the principal reasons on which we base this opinion is our view that it is possible and probable that the medical profession will be able to provide insured persons entitled to ophthalmic benefit with the service of oculists at an early date, and at fees within the limit of the funds from time to time available to approved societies for this purpose. We hope, also, that such a service will be extended to the non-insured population. If, however, for any reason, these hopes are not fulfilled within a reasonable time, we do not wish our report to preclude the possibility of a reconsideration of the question in the light of the circumstances then existing."

The Bill was dropped.

4. For some years many approved societies have been giving ophthalmic benefit to their members, and many of them have insisted on, or have encouraged as far as possible, a medical examination. A certain amount of control over opticians who do insurance work is exercised by a committee—the Ophthalmic Benefit Approved Committee—and the Ministry of Health emphasized its preference for a medical eye examination wherever possible in the following quotation from the instructions given to the committee:

> "The Joint Committee attach great importance to the provisions in the Additional Benefit Regulations under which insured persons are allowed, subject to certain conditions, to have their eyes examined by ophthalmic medical specialists, and it must be understood that the Approved Committee will do nothing which will tend to discourage such examinations, but that, on the contrary, they will take such steps as may be open to them to encourage the development of a satisfactory and widespread service including the provision of examination by medical specialists."

5. In spite of this, a large majority of insured persons are still dealt with by sight-testing opticians. The reason is largely financial, as most of the societies grant only 5s. towards the cost of the examination, and the fee of the eye specialists employed by the National Ophthalmic Treatment Board (a body which provides an eye examination by specialists only) was, until January, 1944, 10s. 6d. and is now 15s.

6. The National Ophthalmic Treatment Board is a body consisting of representatives appointed respectively by the British Medical Association and the Guild of British Dispensing Opticians. It was set up because of the hint, or rather challenge, which is contained in the last paragraph taken from the report of the Departmental Committee quoted above. The Board can make no profits. It provides an examination by eye specialists who are approved by the Ophthalmic Group Committee of the British Medical Association, at a reduced fee. The glasses are supplied by dispensing opticians at prices fixed by the Ophthalmic Benefit Approved Committee. The Board has been in operation for over 15 years and has extended to many parts of the country. At the outset of the war it had over 450 centres in England and Scotland, Wales, and Ireland, and its list of eye specialists included nearly 900 practitioners who had been approved, after examination of their credentials, by the Ophthalmic Group Committee of the B.M.A. Of the total number, nearly 600 held hospital eye appointments and/or possessed a special diploma in ophthalmic medicine and surgery. During this war its services have been widely used by the Royal Air Force and the War Office in the examination of the eyes of recruits. This pioneer effort to provide an organized medical eye service, though only for a limited section of the population, has accumulated experience in organization which may prove useful in the inception of a national service.

7. A national medical service should give a complete general institutional and specialized service, and it should give it by means of properly qualified doctors. So far as the eye service is concerned, it would appear that it would not be possible at the present time to provide a service in which all the routine refraction examinations would be done by medically qualified refractionists. The number of these doctors at the present time would be insufficient to meet the demands of a general service for eye examination and treatment by the State. It is believed, however, that even now the supply of fully qualified men is sufficient to supervise the care of the eyes of the community. It is certain that at the end of this war large numbers of young and experienced registered medical practitioners will return home, and therefore special facilities should be arranged for such of them as desire to do ophthalmic work, so that they shall have adequate training at ophthalmic centres or in the medical schools in order that they may sit for the ophthalmic diploma and enter practice. To meet the situation it is proposed that the examination of all eye cases shall be the responsibility of a medically qualified specialist, but that he shall be assisted by selected refractionists. So far as is known, there has been little alteration in the educational curriculum of the optician since the report of 1927, and medical observers of this curriculum are of opinion that, though the technical training at the best schools is excellent, that part of it which deals with pathological conditions of the eye is quite inadequate and must necessarily be so if not associated with a regular medical training. This scheme therefore proposes that a medical specialist shall be responsible for every patient, but that he shall be allowed to use the technical skill of selected opticians in refraction work. The optician in such a scheme would have a recognized official status; would be on a State register; and would be encouraged to improve his knowledge and experience under medical direction.

8. The opportunity to join the service as a refractionist should be open to all opticians practising as such at the inception of the service and who can satisfy a standard to be fixed by a body on which ophthalmic surgeons and opticians should be represented.

Object of the Scheme

9. To co-ordinate the ophthalmic services of the nation in order to make an efficient medical eye service available to the whole community.

Essential Requirements

10. (1) Under the National Health Service, examination of the eyes and treatment of eye diseases and defects will be carried out only by, or under the supervision of, properly trained and experienced ophthalmic surgeons. It is most important that all children of, and below, school age who need ophthalmic attention should be examined and treated only by ophthalmic surgeons.

(2) The scheme should be easy to administer and adequately financed.

(3) The benefits of the scheme should be open, on the same basis as other consultant services, to all who come within the scope of the National Health Service.

Outline of Main Features of the Scheme

11. There will be four units in the scheme:

(1) The ophthalmic surgeon.
(2) The assistant ophthalmic surgeon.
(3) The clinical assistant.
(4) The medical auxiliary.

(1) THE OPHTHALMIC SURGEON

12. He will be in charge of a hospital unit and he may also perform duties at satellite ophthalmic centres. He must be one who by qualification and experience is competent to deal with any branch of ophthalmic surgery and medicine, including refraction, and to direct the work of his assistants.

(2) THE ASSISTANT OPHTHALMIC SURGEON, AND (3) THE CLINICAL ASSISTANT

13. These will be either (*a*) one of junior status who is qualifying for a senior post involving consulting and operative work, or (*b*) a medical practitioner of approved competence to do refraction work and to carry out ophthalmic diagnosis and treatment, excluding major operative measures. At the inception of the scheme all such practitioners now in practice would be entitled to admission. The ophthalmic surgeon or one of his assistants shall decide whether the case is one for examination of a refractive error or for some other form of treatment. All patients shall in the first instance be interviewed and examined by one of the ophthalmic medical staff and remain his responsibility.

(4) THE MEDICAL AUXILIARY

14. Auxiliary services include opticians and orthoptists. Opticians may be divided into two classes: (*a*) refractionists and (*b*) dispensing opticians. All opticians admitted to the service will possess a stated minimum of training and experience appropriate to their work.

The Refractionist

15. The part played by the refractionist will be to measure errors of refraction in cases referred to him and to perform any other technical duties required of him. He will not be allowed to practise independently of the medical profession. He will be under the disciplinary control of a statutory body upon which both the medical profession and opticians are represented. No refractionist working under the scheme shall be in a position in which he may be financially interested in the sale of spectacles.

The Dispensing Optician

16. Facilities for the dispensing of spectacles may be available at the centre, clinic, or hospital, but patients should be free to obtain their spectacles from a dispensing optician of their choice. Opticians recognized by the service as dispensing opticians shall be on a register which will guarantee their possession of a stated minimum of training and experience. They will confine themselves to dispensing, undertaking not to engage in the testing of sight. The spectacles supplied under the service arrangements,

which shall be of a price and standard and quality approved by the medical profession and shall include a full choice of frames within the price limit fixed by the service, will be dispensed by the approved dispensing opticians on the approved list. State grant will be paid only in respect of spectacles dispensed by approved dispensing opticians. All dispensing opticians must, if so desired, submit for the approval of the ophthalmic surgeon the spectacles he has prescribed.

The Orthoptist

17. Any orthoptist employed by the service must be in possession of a certificate of proficiency recognized by the Board of Registration of Medical Auxiliaries.

Regional Direction of the Scheme

18. In a few of the larger cities and/or university centres there will be established Ophthalmic Institutes at which research work will be done and higher education given. The absence of such institutes in this country has placed it at a disadvantage with some other countries; and the establishment of a National Health Service, including all specialized services, offers an opportunity for remedying this defect.

In general, a hospital of suitable status will be the centre of regional administration. Each region also will have a number of major ophthalmic hospital centres which will be autonomous units and part of the regional scheme. In these hospitals the beds and operative facilities for eye work should be segregated.

Some minor centres for ophthalmic work will be linked up with the regional and major ophthalmic hospital centres. These will be so located as to meet the convenience of the population. They will vary in size and importance according to local circumstances. The rural population will be served by periodical visits from the staff of the regional centre or major ophthalmic hospital unit.

A model centre would consist of: (*a*) Waiting room. (*b*) Consulting rooms. (*c*) Office for secretariat and records. (*d*) Theatre for minor oprations. (*e*) Room for orthoptic training or for other purposes. (*f*) Accommodation for dispensing optician. Other ancillary services will be necessary. There should be freely available laboratories for pathological investigation, with, in regions of suitable size, a special ophthalmic pathologist and bacteriologist. In addition, there must be the fullest co-operation with all the other medical activities of the service.

The personnel of the centre would include: (*a*) Ophthalmic and/or assistant ophthalmic surgeon. (*b*) Refractionist. (*c*) Dispensing optician. (*d*) Orthoptist. (*e*) Pharmacist. (*f*) Nurse. (*g*) Secretary-receptionist. (*h*) Social worker and/or health visitor.

Conditions of Service

19. In the National Eye Service ophthalmic surgeons will normally be employed on a part-time basis, although there may be, in addition, some whole-time appointments. The employment of part-time officers will be necessary in order to provide that those patients who desire to obtain their services privately shall be able to do so. There shall be no bar against such a person taking advantage of the institutional facilities provided by the National Service even if he should get his first advice outside the ordinary system and pay for it. If such a person enters a private ward or wing or block the surgeon in charge of the case should be at liberty to charge his private fee.

Fundamental Requirements

20. There are four requirements in negotiating the inception of such a service which need special emphasis as being fundamental to its success:

(1) The medical personnel who have to work the scheme must have adequate representation on any body which negotiates its inception.

(2) They must have adequate representation on all bodies which administer it after it begins work.

(3) Their remuneration and status must be equal to those of other consultants and specialists.

(4) Adequate compensation to all medical practitioners entering the service for loss of the capital value of the goodwill of their practices.

NATIONAL HEALTH SERVICE IN SOUTH AFRICA

COMMISSION'S REPORT WELCOMED BY PROFESSION

The recommendations of the National Health Services Commission in South Africa, which has lately reported, were summarized in the *Supplement* of April 7 (p. 52). The Commission, appointed in 1942, was charged with an inquiry into the provision of a service in conformity with the modern conception of health which would ensure adequate medical, dental, nursing, and hospital attendance for all sections of the people of the Union.

The report of the Commission has been received with great satisfaction by the medical profession in South Africa. The *South African Medical Journal*, the organ of the Medical Association of South Africa (B.M.A.), describes the report as "a solid piece of work and well worth waiting for," and says that "it is completely in accordance with the principles demanded by the medical profession." One of these leading principles is that the provision of more doctoring for the community is no solution to the problem of meeting its health needs efficiently, and that although more and better facilities for treatment are required, there is even greater need for cutting at the roots of the ill-health and disease in the population by drastic reforms in such fields as nutrition, housing, and physical education, rehabilitation, and social security generally. The Commission pays the Association the compliment of quoting verbatim from its memorandum of evidence in this connexion.

Another point on which the Association strongly insisted was that all health activities should be under a unified control, and here again the Commission has given it as its considered view "that, whether the present total expenditure on health services be adequate or not, the fundamental bar to effectiveness is a lack of unified direction and control of these which are at present operated independently or semi-independently by several central Government Departments, by four provincial administrations, and by numerous local authorities and voluntary organizations." Unfortunately, on this point, from a White Paper entitled "Outline of Post-war Construction," which the Government of South Africa has issued, it appears evident that the Government has no intention of providing a unified service, but rather of maintaining the present state of divorce between intra- and extra-institutional services.

The profession also welcomes in the Commission's report the suggested provision at all levels from the health centre right up to the central administration of representation of the various professional and technical groups in the service; also the proposed compensation of those who have given up their practice to join the service; and, generally, to preserve choice of doctor, the doctor-patient relationship, and the doctor's clinical responsibility to his patient.

The scheme which the Commission has proposed, says Dr. F. R. Luke, president of the Cape Western Branch, who was nominated by the Medical Association to serve on the Commission, "will, I feel sure, be welcomed by the public; [it] safeguards every legitimate interest of the profession involved, and constitutionally, financially, and administratively is possible of adoption by the Government."

A special meeting of the Federal Council of the Medical Association, which was called to consider the report, welcomed and supported the recommendations for the provision of personal health services in so far as these corresponded with the evidence given by the Association to the Commission, adding that such points of difference as existed were capable of adjustment by negotiation. The members of the Association "are prepared to co-operate whole-heartedly in a National Health Service for the prevention and treatment of disease provided the State for its part will demonstrate its earnest intention of dealing as radically with the causes of preventable ill-health." Attention is drawn to the fact that the profession has always considered it a moral obligation to provide medical assistance to all who may require it, irrespective of their ability to pay, and has hitherto fulfilled this self-imposed obligation to the best of its ability by providing services gratuitously or at reduced rates to large sections of the community. The Association hopes that the Government will put consideration of the urgent and serious health needs of the country above any legislative or political expediency and will implement in broad outline the recommendations of the Commission, after further consultation with interested bodies.

The Pharmaceutical Society of Great Britain, the National Pharmaceutical Union, and the Pharmaceutical Standing Committee (Scotland) have jointly submitted a statement on Pharmacy and a National Health Service to the Minister of Health and the Secretary of State for Scotland. It is urged that a patient should be free to receive from his doctor a prescription which he should be able to take to his own chemist's shop, and that medicines required at health centres should also be supplied to the patient from the chemist's shop. Other points in the memorandum are that an effective central body of pharmacists ought to be set up to advise the Minister of Health on the pharmaceutical side of the National Health Service and to administer it; that the payment be such that the service in each chemist's shop shall be self-supporting; that hospitals should have pharmaceutical departments staffed by pharmacists; that all medical supplies used in clinics and health centres should be under pharmaceutical control; and that all branches of the pharmaceutical services in an area should be co-ordinated.

HEARD AT HEADQUARTERS

The New President

At the meeting of the Council last week (the "Proceedings" of which will be published in our next issue) Mr. H. S. Souttar was, with general acclamation, appointed President of the Association in succession to the late Viscount Dawson of Penn, the appointment to run until the Annual Representative Meeting at the end of July, at which the Council will make a recommendation that he be elected President for the ensuing year. Mr. Souttar received an ovation when he entered the Council chamber and was informed of his appointment, and again when he was invested with the badge of office.

Not many former Presidents have had such a record of Association service behind them. Mr. Souttar has been a member of the Council since 1922; he has been Chairman of the Marylebone Division and President of the Metropolitan Counties Branch. On many central committees he has given generously of his time and his wisdom and experience. Association work with which he has been prominently connected includes the report of the committees on the treatment of fractures, on patents, on medical education, and on the reorganization of Association machinery. In recent years he has been Chairman of the Representative Body, Chairman of Council, and Chairman of the Medical Planning Commission. Towards the end of 1942 he undertook an important Government mission which necessitated a journey to India. His work on the Central Medical War Committee and on the Negotiating Committee has been of outstanding value.

From Chairman to President

In accepting the presidency Mr. Souttar said that he thought he was the first Chairman of Council to occupy that position. That, however, is not the case. The founder of the Association, Sir Charles Hastings, after he had been Chairman of Council for seventeen years, was made President in 1849 when the Association met in his own city of Worcester. Dr. R. W. Falconer, who held the chair from 1874 to 1877, became President the following year. Dr. J. Ward Cousins, who was Chairman of Council from 1892 to 1895, became President in 1899, and his successor in the chair of the Council, Professor Robert Saundby, became President much later, in 1911, when the Association met in Birmingham. Mr. Souttar is, however, the first London surgeon to be President since Sir Henry Butlin in 1910.

The S.R.M.

Reasons of State prevent publication of what was said and done at the two-day Special Representative Meeting, but some general impressions may be added to those recorded in a leading article elsewhere in this issue. The meeting made a record in agendas, with more than 400 amendments from Divisions, and yet it was all compassed within two days—solid sitting days, certainly, from early morning until early evening—and it would be surprising to learn that anyone in charge of an amendment went away with a grievance.

It is true, of course, that many amendments never reached the stage of being proposed. They were covered by similar amendments from other Divisions, so that progress through the agenda was by a series of kangaroo jumps, when it was discovered that twenty amendments were very like the one which had already been dealt with. Thus the meeting, whose programme, the Chairman confessed, made his heart sink when he first saw it, reached a series of decisions which, whatever history may say of them, were at least definite, consistent, and in logical sequence.

In spite of the absence of the constraint which the Press ordinarily imposes the meeting was friendly from start to finish. Only once had hands to be counted on a division, and that not because there was any doubt as to the way the vote had gone, but simply for the purpose of putting the numbers on record. Very few speakers transgressed the time limit, though quite early in the meeting a limit of five minutes for proposers and three for other speakers was imposed, and in no case was it extended. The movers of amendments were commendably brief. Some contented themselves with the words, "I move"; others would say, "The amendment is fully set out on the paper, and I have nothing to add to it"; and it was not noticeable that such amendments fared worse than those which were introduced with a lengthy speech.

The meeting was not without its humours. One frequent speaker—a surgeon—exhibited a large placard which he said had been worked for him by one of his patients—a signwriter—in gratitude for the removal of his appendix. The placard showed a diagram of the administrative structure as the last Representative Meeting had proposed it.

Two Chairmen

Dr. Peter Macdonald again furnished an example of first-rate chairmanship, always punctilious in preserving the utmost freedom of discussion, and yet ever mindful of the time-table. His autocracy—"I rule that it is so"—was exactly suited to such a meeting. Representatives in charge of motions had to keep a close vigil. A moment's absence from the hall and their amendment might be called, and in their absence the Chairman would move it, and again in their absence ask permission of the meeting to withdraw it.

Dr. Macdonald was ably assisted in the deputy chair by Dr. J. B. Miller, whose dry humour lightened the labours of the meeting. When one amendment was put to a meeting which had become a little lethargic, "I declare it carried," said Dr. Miller, "by about seven votes to two."

The Father of the Assembly

Dr. Guy Dain again scored a personal triumph at the meeting. He was ready to answer any point, and always concisely. Over and over again a hasty and unwise decision was averted by his intervention. Not often in Representative Meetings has the note of affection as well as of admiration been so conspicuous. Some of the great leaders of the past, like the late Sir Henry Brackenbury, inspired great respect and could sway decisions, but they hardly evoked the feeling which was evident in the singing of "For he's a jolly good fellow" in Dr. Dain's honour as the meeting ended. Dr. Dain, in reply, said that he hoped he might be strong and active enough to serve the Association "at any rate until this great business is through."

Press not Admitted

Meetings *in camera* are not the B.M.A. way. The Association would not merely have tolerated but would have welcomed publicity. Although medicine and medical affairs often need handling with more reticence than other subjects, few professional organizations or public bodies have been so open to the Press. Occasionally the Association has suffered from distorted reports in some of the less responsible newspapers, but it has adhered always to its policy of inviting the Press and giving them every assistance in reporting its meetings. If on occasion things have had to be said at the Representative Meeting which it would have been injudicious or premature to broadcast, the Press have not been asked to withdraw, but merely to refrain from publishing that part of the proceedings, and the request has always been respected.

The *Journal* is affected by the ban on publicity for the S.R.M. No report of the proceedings can be published, but steps are being taken to inform members of the profession of the trend of the discussion and the decisions.

A Local Document

A question involving the autonomy of Divisions came before the Council. In September last the Guildford Division issued to Divisions and Branches a leaflet entitled, "How the Proposed National Health Service will affect you." It was a leaflet intended for the general public. To this leaflet another Division took strong exception, holding that it put forward a policy concerning the White Paper which had not then, and has not now, been adopted by the Association, yet the words "British Medical Association," even though immediately qualified by "Guildford Division," would make the average member of the public suppose it to be a B.M.A. document. It also complained of money being spent by a Division on the propagation of a policy not yet the policy of the Association. The point is, of course, that the Association is really a federation of local units; that is its strength and its occasional weakness. A large amount of autonomy exists among these units, and if they are free to express their views on medical organization they should be entitled also to spend money out of their grant for the publication of such views.

On one point the covering letter issued with the Guildford leaflet was in error. It was stated that this local document had been approved by the Public Relations Officer of the Association. No endorsement had been given by that officer or by his department. The Council considered that in fairness to all concerned this should be made known. It also handed on to the Public Relations Committee the nice problem whether money provided for public relations work should ever be spent in furtherance of policy which, though approved by the Division, has not been approved—or has been disapproved—by the Association at its centre.

Correspondence

Postgraduate Training

SIR,—So now we know the scheme for postgraduate training of Service medical officers, and what a parsimonious scheme it is. As one of those in Class 1, I will confine my criticisms to this section only.

Six months' hospital training is not enough. Most Service doctors with long terms of service have been dealing almost exclusively with healthy young males, and have almost forgotten how to treat the more chronic diseases of the elderly and diseases of women and children, to say nothing of midwifery. I suggest six months in a general hospital, followed by three months each in a maternity hospital and children's hospital.

The proposed salary of £350 is grossly inadequate. After five or more years of service we are surely entitled to a decent wage for what will no doubt be a hard day's work. We ask for no charity, but only that our pay shall be commensurate with the work done. Of course we shall be told that in addition to our salary we shall be securing training, but this excuse for semi-slave labour conditions is wearing a bit thin. No doubt our munificent gratuity was in mind when the sum of £350 was decided upon!

What does it mean that for "those with family commitments assistance under the Further Education and Training Scheme may be available"? Why cannot we have details of this? Does it mean that in order to be able to continue to support our families we shall have to apply through the well-known channels of forms, petty officials, and delays? We all know how generously this assistance will be given, if at the end of 3 or 4 months we are lucky enough to qualify. Is the dignity of our profession to fall as low as this? I suggest that we should continue to receive our Service rates of pay and allowances for the training period.

There is still no indication that the authorities are alive to the need for providing married quarters for returning Service M.O.s. This point has been raised in your correspondence columns before. It should be realized that they are not dealing with a body of newly qualified practitioners with no responsibilities; but with men of five or more years' Service experience, who will be in no mood to tolerate any further unnecessary interruption of their domestic lives.—I am, etc.,

W. B. JAMISON,
Surg. Lieut.-Cmdr., R.N.V.R.

Medical Planning

SIR,—It is high time for someone to come forward and give the true facts regarding the root cause of such weaknesses as are present in our professional structure. I have waited in the hope that some more able pen than mine would perform this unpleasant duty, but I am afraid to wait any longer or it may be too late.

The fact is that, as a body, we behave like a disarticulated skeleton. We are tabetic in our attempts at co-operation, and we are so disorganized and dissatisfied among ourselves that we are prepared to hand the whole structure over to a quack in the hope of a brilliant cure. Before any cure can be started we must find out where the disease lies, and, in my opinion, this fault lies among the doctors themselves.

Doctors are, among themselves, a most extraordinary body. They are egotistical and inordinately jealous of each other. Judging from the number of letters so far published, they blame everything under the sun except themselves for their shortcomings. It is an extraordinary but true fact that soon after a man begins to practise he changes type. No one will deny that medical students as a body are excellent fellows and mix well together, but the effect of a little praise and "back-scratching" from a few patients causes a most remarkable metamorphosis, and the change in character becomes steadily more pronounced with years. The result of this is that most doctors become as busily occupied in making the right impression, for on that their livelihood depends, as in practising the true academic art of medicine. This is obviously wrong and the system needs uprooting.

The cure, however, is simple. Give the doctors a chance to play football together again. In other words, let them work together in health centres, where they will really get to know each other, learn to enjoy each other's company, have the opportunity of exchanging opinions and of knowing each other at first hand, instead of misunderstanding each other at second hand. We have heard too much lately about the importance of doctor–patient relationship. The relationship between doctor and doctor is infinitely more important, yet it has never been given the slightest consideration. How many doctors really know their colleagues intimately? I am sure that it is a disgracefully low proportion.

How should the health centres be run? By the doctors, of course. Each town should be divided into units of, say, 10,000 population, each unit having its health centre with a proportionate number of doctors. All the units are part of one big partnership run by a medical committee with the aid of a non-medical manager and a few clerks. I think the non-medical manager is very important. All fees are then pooled by the town partnership and divided in some pre-arranged proportion. This does away with all political control, and leaves the total medical income for each town as before. It also gives all the other advantages resulting from co-operation, regular holidays, opportunities for postgraduate study, and, what is most important, really friendly understanding among the doctors.—I am, etc.,

Porthcawl. R. HODKINSON.

A Workable Service

SIR,—The profession is being discredited by insidious centrally inspired propaganda, which has for its purpose the turning of public opinion against us and intimidating us so as to increase our vulnerability to attack. That this propaganda is having some success is shown by the vacillating attitude of those of our colleagues who have not yet decided on which side of the fence they wish to land. We have all met them and listened to the same argument: "If we press for the continuation of the panel system, even on an extended basis, public opinion, which is already critical, will turn against us completely."

We are well aware that the B.M.A. has for years been suggesting improvements to the existing system; but successive Governments have turned deaf ears to every approach. Why, then, knowing that we have right on our side, should we persist in modest silence, which is doing so much harm to our cause? Is it not time that we took our stand uncompromisingly, stating plainly that we will not be "hi-jacked" into a form of service we do not desire, and laying down the form of service we will work? If we have right on our side we need not fear public opinion; rather should we set out to educate it: that far from getting a first-rate service for nothing, the public will pay for it in the form of rates and taxes; and instead of being served by doctors as they know them to-day, they will be dealt with by civil servants who will treat them not as private individuals but as so many "cases."

There is no need for the extravagance of widespread health centres to replace doctors' surgeries. These would only have the effect of adding to the cost of the service without any benefit to doctor or patient. Would patients prefer to congregate at cold, impersonal centres rather than in the doctor's familiar waiting-room? I doubt it. And since it would not be possible to build a centre at every street corner, would patients mind the extra distances they would have to travel in order to see the doctor? However, we do need investigation clinics, where practitioners could admit their patients to beds for investigation and special treatment. These need not be numerous because they would be used only for special purposes. They would, however, lighten the work of hospital out-patient departments and give general practitioners the opportunity to do real clinical work. Add to that, extension of the N.H.I. system to dependants, and a panel of specialists who would be available for consultation and advice, and you have a perfect National Health Service. It is important that in time local hospitals should be developed with general-practitioner beds and specialists attached.

If the present system is extended to dependants it will mean, for the first few years at any rate, very full lists for all doctors engaged in N.H.I. But within a few years there will be a large influx of new doctors into the N.H. service, with consequently a more equable distribution of patients; when lists will become less crowded. If we accept a low capitation fee now, it will not be easy to get it increased when our lists diminish. We know from sorry experience that once a figure is fixed it tends to remain so. If it moves at all, it is in a downward direction. We must insist on the principle of payment for work undertaken, no matter how great our incomes as a result. I suggest payment at the rate of £1 per annum for every insured person on our lists. Later, as our lists reach more manageable proportions, our incomes will be consequently reduced, but still leaving us, however, with adequate returns. When this stage is reached we shall have a service difficult to improve upon, with all concerned getting a fair deal.—I am, etc.,

Stretford. MENDEL MARCUS.

The Public Health Services and the Profession

SIR,—After reading through the report on the negotiations by the Council of the B.M.A., I am reminded of a comment attributed to M. Clemenceau, who, after listening to a twenty-minutes speech by A. J. Balfour, looked at him perplexedly and said, "Is it finished—but are you for or are you against?" That is exactly the question I would ask; are we for or are we against a State-controlled profession?

In its White Paper analysis (March, 1944) the B.M.A. has laid down among the principles approved by the Association that "it is not in the public interest that the State should convert the medical profession into a salaried branch of central or local government service." Thus it would seem that these negotiations must break down. One need go no further than page 2 of the report to find that central responsibility to Parliament and the people is to rest with the Minister of Health. On this basis the Minister appears to have taken a firm stand, so that the question we have to face is whether we are prepared to accept State control. Those who have any hesitation in answering this question must realize that State control would govern their conditions of service, salaries, their relations with the public, the clinical exercise of their profession—in fact, they would be at the entire mercy of the State, the degree of control varying with the particular political party in power.

We in the Public Health Service have had a good deal of experience in serving the State, whether as officials of local or of central government. We know the fight we have had and indeed are having to maintain a standard of life collateral with that of our colleagues. It is part of the age-old struggle raging the world over—the struggle between "the haves" and "the have nots." If we surrender our freedom what would be the use of carrying on that struggle, when the ultimate decision must lie with those by whom we are employed, and there is no alternative but to accept that employment? Let me say emphatically that, however high the motive, whatever promises are held out, anyone who surrenders his freedom is a fool and a traitor to his profession.

In our particular case it may be said that conditions of service are not unreasonable; but that position we owe to our colleagues in private practice and not in any way to the generosity of our employers. As soon as private practice is eliminated new comparisons will be drawn, as in the case of the teaching profession. A graduate in an elementary school, for example, is no better off than a non-graduate. As soon as any question is asked concerning such a relationship the bogy of class distinction is brought forth and there it ends.

We who are content to pursue the even tenor of our way, to work quietly and conscientiously without uncorrupting thoughts of power or high reward, must take cognizance of the fact that we are but a section, a very small section, of the community, apt to lose sight of the influences gathering around us. We need not go outside the sphere of public health to realize that compulsion and dictatorship are at our very doors. The Vaccination Act is still with us, and, much as I appreciate the value of vaccination, I detest a compulsory Act which so infringes the freedom of the individual.

There is a first-class example of dictatorship in Form 1, Appendix 1, Ministry of Food Defence (General) Regulations, 1939, which sets out the authority to operate a milk heat-treatment plant "pursuant to para. (3), Regulations 55G, of the Defence (General) Regulations, 1939." Under this the Minister of Food may authorize the establishment of a pasteurizing plant subject to no alterations without consent; moreover, the authority may be revoked at any time without reason assigned, so that anyone setting up a pasteurizing plant involving considerable capital outlay may be called upon to close his business without being able to ask a single question about it. When we realize the extent to which power may be vested in the State, well may we become apprehensive, particularly when it is known that certain political parties seek to establish and extend such power. Thus I make no excuse for exhorting every medical man inside and outside the public health service to use his utmost influence in condemning the idea of a State-controlled profession. Truly is it said that State control is not in the public interest; more than that, it is the seed of bloody revolution, decay, and death.

The White Paper on a National Health Service is an integral part of Sir William Beveridge's scheme for social security, and no doubt some of us may have ideas on its value in a free society. The only road to social security of which I am aware is by way of industry and thrift. This applies generally, as much to one section of the community as to another, and I see no valid reason why those who will not have work, who are lazy, inefficient, or treasonable, should share the reward of those who are content to work faithfully and conscientiously and make their own provision for life's contingencies. "If a man worketh not, neither shall he eat," said St. Paul. We may not like it, but there is no escaping its truth, and to controvert the principle is sheer political chicanery.

This surge towards State control of which the medical profession is to be the spearhead must be withstood at any cost, and I hope if the Society of Medical Officers of Health is asked for its support, that support will be forthcoming unhesitatingly, ungrudgingly, and decisively.—I am, etc.,

Keighley. H. M. HOLT.

H.M. Forces Appointments

ARMY

Col. S. Arnott, C.B.E., D.S.O., late R.A.M.C., has been granted the local rank of Major-Gen.

ROYAL ARMY MEDICAL CORPS

Capts. R. J. G. Morrison, D. S. Cochran, and A. M. Pugh, and Capts. (War Subs. Majors) J. W. Orr, M.C., J. A. MacDougall, A. C. Cox, A. Gleave, J. H. Taylor, D. Wright, and G. C. Dansey-Browning to be Majors.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

War Subs. Major A. N. Smith has relinquished his commission on account of disability, and has been granted the honorary rank of Lieut.-Col.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capts. I. M. Orr, O.B.E., and W. S. Gross have relinquished their commissions on account of disability, and have been granted the honorary rank of Major.

War Subs. Capts. J. P. Matthews and G. S. Robertson have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

To be Lieuts.: G. L. Broderick, F. McNaughton A. D. Charters, G. K. Lloyd, and D. G. MacInnes'

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

War Subs. Capt. (Mrs.) I. M. Y. M. Petrie has relinquished her commission on account of disability.

ROYAL AIR FORCE

RESERVE OF AIR FORCE OFFICERS

Squad. Ldr. (Temp.) J. D. Tonkinson has been granted the rank of War Subs. Squad. Ldr.

Fl. Lieut. (Temp. Squad. Ldr.) J. S. Richardson has relinquished his commission on account of medical unfitness for Air Force service, retaining the rank of Squad. Ldr.

AUXILIARY AIR FORCE

Squad. Ldr. (Temp.) I. R. Jones has been granted the rank of War Subs. Squad. Ldr.

ROYAL AIR FORCE VOLUNTEER RESERVE

Squad. Ldr. D. W. McLean has resigned his commission, retaining his rank.

Squad. Ldr. (Temp.) G. R. Gunn has been granted the rank of War Subs. Squad. Ldr.

Fl. Lieut. (Temp. Squad. Ldr.) W. Heath has resigned his commission, retaining the rank of Squad. Ldr.

Fl. Lieut. R. W. G. Grindley has relinquished his commission on account of medical unfitness for Air Force service, retaining the rank of Squad. Ldr.

Fl. Lieuts. J. E. E. Morgan, P. G. Swann, and I. A. MacDonald have relinquished their commissions on account of medical unfitness for Air Force service, retaining their rank.

Fl. Lieuts. G. M. Pringle and J. N. N. Robinson have resigned their commissions, retaining their rank.

To be Flying Officers (Emergency): R. D. T. Cape, T. M. Fraser, D. M. Jeffreys, J. Millar, W. Phillips, H. D. W. Powell, C. M. Ross, J. D. Sammon, C. W. Shearer, J. G. Sommerville, J. W. Sutherland, and L. R. Twentyman.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1) Week-end course in thoracic surgery, at Harefield Hospital, all-day, Sat. and Sun., May 26 and 27: (2) Week-end course in diseases of women, at Elizabeth Garrett Anderson Hospital, all-day, Sat. and Sun., June 2 and 3 (women postgraduates only); (3) Week-end course in ophthalmology, at Royal Westminster Ophthalmic Hospital, all-day, Sat. and Sun., June 9 and 10; (4) General surgery at North Middlesex Hospital, all-day, Sat. and Sun., June 16 and 17; (5) Ear, nose, and throat, at Metropolitan Ear, Nose, and Throat Hospital, all-day, Sat. and Sun., June 30 and July 1. Further particulars can be obtained from the Fellowship of Medicine, 1, Wimpole Street, W.

WEEKLY POSTGRADUATE DIARY

GLASGOW UNIVERSITY: DEPARTMENT OF OPHTHALMOLOGY.—*Wed.*, 8 p.m., Miss D. E. Feather: Indications for Orthoptic Treatment of Squint.

DIARY OF SOCIETIES AND LECTURES,

ROYAL SOCIETY OF MEDICINE.—*Wed.*, 2 p.m., Section of Physical Medicine. *Thurs.*, 5 p.m. Section of Dermatology. *Fri.*, 5 p.m., Clinical Section; 5 p.m., Section of Obstetrics and Gynaecology; 6.30 p.m., Section of Radiology.

MEDICAL SOCIETY OF LONDON, 11, Chandos Street W., *Mon.*, 5 p.m. General Meeting; 5.15 p.m. Annual Oration by Dr. F. M. R. Walshe; Integration of Medicine.

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE.—At 26, Portland Place, W., *Thurs.*, 3 p.m., Col. H. E. Shortt, I.M.S.: Recent Work on the Transmission of Kala-azar in India. A discussion will follow.

B.M.A.: Branch and Division Meetings to be Held

HEREFORD DIVISION.—At Garrick A.R.P. Post Widemarsh Street, Hereford, Fri., May 18, 4 p.m. Prof. A. C. Frazer (University of Birmingham): Sulphonamides in General Practice.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. for 18 words or less. Extra words 3s. 6d for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.

BIRTHS

HUTTER.—On March 3, 1945, to Mary (Squiggles), wife of Surg. Lieut. Duncan Hutter, R.N.V.R., a son—Christopher Duncan.

JOHNSON.—At Middlesex Hospital, London, on April 21, 1945, to Gréta (*née* Baxter), wife of Dr. Maurice W. Johnson, of Auckland, N.Z., a daughter (Ann).

KIDD.—On April 17, 1945, at Hexham, the wife of Surg. Lieut. J. D. Kidd, R.N.V.R., a daughter.

WHARTON.—On April 29, 1945, the wife of Dr. Christopher L. Wharton, of Kineton, Warwickshire, a daughter.

DEATHS

McCURDIE.—On April 30, 1945, at 76, Southfield Road, Middlesbrough, James Ronald, *M.C.*, M.B., Ch.B., beloved husband of Julia McCurdie, aged 56.

WRIGHT.—On April 29, 1945, at the Salford Royal Hospital, Garnett Wright, F.R.C.S., the beloved husband of Lucy J. Wright, of Thornfield, Broad Road, Sale.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY MAY 19 1945

British Medical Association

PROCEEDINGS OF COUNCIL

A meeting of the Council was held at the B.M.A. House, London, on Wednesday, May 2, Dr. H. GUY-DAIN presiding.

Election of President

The first business of the meeting was to appoint a President in place of the late Viscount Dawson of Penn. Dr. Peter Macdonald proposed that Mr. H. S. Souttar be appointed President until the Annual Representative Meeting, and that the Council recommend the Representative Body to elect Mr. Souttar as President for the ensuing year. He mentioned Mr. Souttar's great services to the Association and his fitness for the office. The nomination was seconded by Mr. A. M. A. Moore, supported by Dr. J. W. Bone and Dr. S. Wand, and accepted with acclamation. On being called into the Council room Mr. Souttar said that it was impossible for him or anyone to fill the position of Lord Dawson, but he would do everything in his power to maintain the dignity of the Association.

Resolutions of the A.R.M.

The Chairman reported on the action taken on the resolutions passed by the Annual Representative Meeting last December. Many of these had been referred to the Negotiating Committee and had been taken into consideration in the negotiations so far as they had proceeded; a number of them related to matters which the Negotiating Committee had not yet reached. Some of the resolutions concerned the finding of employment for doctors demobilized from the Services. The Central Medical War Committee was considering what could be done for these doctors, but the essential phrase in one of the recommendations was "guarantee employment," and that was quite impossible. It was agreed by the Council that the Association could not "guarantee." The Secretary pointed out that it would be wrong to assume that there were dangers of serious unemployment, bearing in mind the gradual nature of demobilization, and it would be wrong also to assume that nothing was being done to place in jobs those who needed one on their return. The Local Medical War Committees had been used for this purpose before, and if these bodies were still in existence when this problem arose in its full form they would be used again.

The President said that the question of arranging for the support of men returning from the Services and undertaking a refresher course had been considered at a conference which he had attended. If the Ministry was going to take the responsibility of providing a medical service for the country it was essential that it should see to it that the men who took up this work were thoroughly competent, and it should be prepared to pay for ensuring competence.

At a later stage in the Council proceedings the Insurance Acts and General Practice Committees brought forward a report on schemes for post-war financial assistance for medical practitioners, the work of a subcommittee under the chairmanship of Dr. J. A. Brown. The report, which included a large amount of financial detail, was commended by the Council, and it was agreed that there be published for the information of the profession a factual statement of the available schemes.

The School Medical Service

Reports on the school medical service under the new Education Act were presented by the Public Health and General Practice Committees.

Dr. S. Wand, chairman of the General Practice Committee, said that the Minister of Education had at first declined to receive a deputation, but later, after the letter which had been published in the *Supplement* had been sent to him, he had agreed to do so. The deputation would urge the Minister to reconsider the position as set out in his circular to local education authorities (Circular 29, issued on March 12), having regard to the extreme shortage of doctors, dentists, and nurses available for civilian purposes. If the Minister did not see his way to introduce amending legislation, as he might not, he would be urged to discourage local authorities from extending their clinic services and to rely so far as possible on established general practitioner and specialist services on lines not antagonistic to the proposed new health service, so that treatment facilities provided under the Education Act could at a later stage be more easily integrated with the National Health Service when it was established.

In the course of some discussion in the Council Dr. J. A. Pridham described the action of the Ministry as "splinter medicine." It was a retrograde step to single out a part of the community and deal with them in the way proposed. He thought it called for strong remonstrance from the Council. The Secretary said that it would be made clear to the Minister that the present shortage of medical personnel applied not only to general practice but to the public health service.

The Council agreed to three recommendations. The first laid it down that for services provided for children covered by the Act payment should be made on an item of service basis, with no contract between the practitioner and the local authority; the second, that for the purpose of these arrangements the reference of patients to a practitioner should not ordinarily be by an officer of the local authority, but through parent or guardian, provided that the school medical officer should not be precluded from referring to a practitioner or hospital children who were found on routine inspection to need medical care, the local authority to be responsible for the practitioner's fee; and the third, that the fee for a general practitioner service for attendance at the doctor's surgery should not be less than 5s., including medicine.

National Maternity Service

The Council considered a report on a National Maternity Service, prepared by the Royal College of Obstetricians and Gynaecologists. Dr. James Fenton called attention to a statement in the report that it was essential that the practitioner should have "special experience" in obstetric work. This demand might be made in every range of medicine, so that there would be no purpose in having a general qualification. A point often overlooked in this connexion was that the medical student during the whole of his training was learning the principles of surgery and the principles of medicine, which applied to midwifery. This sectionizing was against the policy of the Association and not in the best interests of the profession.

Dr. Wand said that it was obvious that the report was prepared by a body of people who had no appreciation of the practical side of domiciliary midwifery. The suggestion that midwifery should be practised only by those who had special qualifications was ridiculous in country areas, and even in urban areas the idea that the midwife was going to wait when she had a case of post-partum haemorrhage until she could obtain the services of someone with special qualifications was also ridiculous.

The Chairman said that the B.M.A. policy for a national maternity service would be one of the subjects which would come up between the Minister and the Negotiating Committee if the negotiations went on. Dr. J. A. Brown criticized the Royal College report, which he described as a confession of failure.

It was agreed, on the suggestion of Dr. F. Gray, that the Association should get in touch with the Royal College of Obstetricians and Gynaecologists and put its views to them in the strongest possible way in the endeavour to get agreement.

Equal Pay

Dr. Fenton, in presenting the report of the Public Health Committee, referred to a question raised by the Medical Women's Federation concerning the difference in the cost-of-living bonus based on the Civil Service scale for men and women doctors in L.C.C. appointments. The Public Health Committee, he said, adhered to its opinion previously given that a cost-of-living bonus was granted, not for services rendered, but on account of increases in the cost of living.

Dr. Janet Aitken said that the women members of the Association were apparently unanimous in thinking that the Association should take action concerning this differentiation. The argument on the other side was that the bonus did not represent payment for services rendered, but she did not know what they were being paid for if not for services rendered. After the last war the cost-of-living bonuses were in many cases included in salaries, and the same thing was likely to occur again. Pensions were based on salary plus cost-of-living bonus. She appreciated that in many cases a higher bonus attached to lower salaries, but that might mean only that the lower posts were under-salaried. There were county authorities which were bold enough to go against the L.C.C. and the Civil Service, and pay equal cost-of-living bonus. She moved the reference back of this part of the report, and this was seconded by Dr. A. Beauchamp, who said that it involved an important matter of principle.

Dr. Fenton said that the committee was not lacking in sympathy with Dr. Aitken over this problem. It felt, however, that cost-of-living bonus was not payment for services rendered. This was not a sex differentiation; it was or should be based on the number of dependants a man (or a woman) had to maintain.

It was agreed that this part of the report be referred back.

Dr. N. E. Waterfield moved approval of the report of the Committee on Equal Pay. This committee, under Prof. Picken, had the task of preparing a memorandum of evidence on the subject, which was submitted to the Royal Commission last December. The report embodying the memorandum of evidence was approved.

Scheme for National Eye Service

Prof. A. H. Burgess, on behalf of the Special Practice Committee, presented the draft scheme for the provision of a national medical eye service. This scheme is the result of prolonged and careful consideration by the Ophthalmic Group Committee, and has been discussed at two series of regional meetings of the Group, to which all who practise ophthalmology, whole-time or part-time, were invited.

The Chairman congratulated those who had produced a workable scheme under great difficulties. Every line of it had been a matter of serious argument from different points of view. It might form a useful model for the setting up of other forms of service within the compass of the proposed National Health Service. It was a carefully constructed and very good document.

The Council gave its approval to the scheme.

Association Finance and Organization

Dr. J. W. Bone (Treasurer) presented the draft financial statement for 1944. It had been a year of great prosperity for the Association. The amount received from subscriptions had increased by nearly £9,000. Several of the reserve funds had been strengthened, and a balance of £3,819 had been transferred to the Balance Sheet.

Dr. J. C. Matthews pointed out that the cost of the *Journal*—that is to say, the amount brought from subscriptions to meet the cost of production and issue so as to balance the income and expenditure account—worked out at only 1s. 3d. per member annually.

The Council approved a recommendation from the Journal Committee to republish in book form a first selection from the series "Any Questions?" which have appeared in the *Journal*, the price to be fixed at 5s. (Paper is not yet available for this purpose.) It also approved in principle the formation of a centralized abstracting service for the use of the *Journal* and of the special quarterly journals published by the Association, and the setting up of a subcommittee to work out administrative details.

Dr. Matthews submitted, on behalf of the Organization Committee, a report on the proposed regional organization of the Association. It was proposed, he said, as soon as national circumstances permitted, to take steps to appoint full-time regional secretaries, giving effect to the resolution of the Annual Representative Meeting, 1943. The report before the Council, which was approved, concerned the functions, appointment, and status of such regional secretaries.

It was also agreed that a British Service Medical Officers Group be formed, and that the establishment of a standing committee for Northern Ireland, analogous to the Scottish and Welsh Committees, be formed. A proposal to have a Foreign Relations Committee, Dr. Matthews said, would be carried a stage further in the next few weeks, when a meeting would be held at B.M.A. House to which a member of the medical services of each of the Allied Forces in this country was invited. The Chairman hoped that this would be a permanent International Relations Committee of the Association.

Charter for Health

Dr. R. G. Gordon presented the draft for a "Charter of Health," the work of the special committee over which Sir John Boyd Orr had presided. He said that the Council should congratulate itself on the production of this document within so short a time. The committee was formed only in December, and it had produced this comprehensive draft of thirteen chapters, covering the subjects of preventable disease, nutrition, occupation, mental health, the family and home, the birth rate, and many others. The result was largely due to the most able chairmanship of Sir John Orr, but thanks were due also to the members of the committee who had produced the various memoranda which were the basis of the report. The report had been brought together and made into a readable and coherent document chiefly by a member of the office staff, Miss Saxby, who had done a remarkable piece of work. The Council was not expected to affirm its agreement with every line of the report, but to give it its general blessing. It was agreed that, subject to some final revision, the report should be published.

Committee on Medical Schools

Mr. Zachary Cope presented, for submission to the Ministry of Health, a report which, in the view of the special committee concerned, should constitute the basis of the Council's observations on the Goodenough report. It was gratifying to note that the Interdepartmental Committee on Medical Schools had substantially accepted the evidence presented to it by the Association. But the report covered a considerably wider field than the subjects on which the Association was invited to give evidence, and accordingly a number of observations were now submitted. Many of the comments were in the nature of endorsement, sometimes with a slightly different emphasis, but on certain points the B.M.A. committee dissented. For example, the B.M.A. committee believed that it would be a mistake to abolish the purely vocational examination, which would be the effect of the opinions expressed by the Goodenough Committee under "Final Examinations." It also dissented strongly from the recommendation that the examination for the D.P.H. should be conducted only by the university providing the training, and it did not agree that diplomas in public health should be awarded solely by the universities providing the courses of instruction in preparation for them. He added that Prof. Picken, who was not present, desired to dissociate himself from the comments on these particular points, and Prof. Picken and Prof. Sydney Smith dissented from another comment in which the B.M.A. committee, while approving the principle that every medical school should be an integral part of a university, held that this should apply only to any new schools that may be established, and that existing schools should be allowed to continue their present work and retain their present organization.

Mr. A. M. A. Moore thought it very important that the Association should support the proposals that the profession should continue to control certain of the qualifying examinations.

Co-educational Medical Schools

Some discussion took place on the question of co-educational schools. Mr. A. S. Gough considered that there were serious reasons why all schools should not be co-educational, and he protested against any discrimination against medical schools which did not make provision for co-education. Dr. Waterfield and Mr. Dickson Wright spoke to the same effect, the latter pointing out that to have some monastic schools in London was an asset to London as the centre of the Empire to which students from the Dominions and Colonies came. Dr. Matthews said that provincial schools were almost bound to admit women, and it seemed reasonable that some of the London schools should be allowed to have men only.

Dr. F. H. Bodman, on the other hand, deplored this regression to mediaeval thinking. Medicine was more than a science, it was a part of the art of living, and to separate men and women at an important stage of their development was to put back medicine. Dr. F. Gray said that they were all agreed that women should have adequate opportunities, as they had not at present. But it was not a case of forbidding co-educational establishments; it was a question under these proposals of making every medical school co-educational. It was a matter for experiment; let there be some schools for men only, some for women only, and some mixed, and then after twenty years it would be possible to decide the matter on the basis of experience. Dr. Martin Brodie said that the real issue was financial sanctions: unless a university was willing to take women as well as men it would not get its grant.

The President said that the question whether men's schools should admit women was a most complex one. At the London Hospital they did have women, and a more able set of women it would have been impossible to find. But what he objected to was the use of "sanctions." He did not think they should come to any conclusion on the policy of co-education, but they should object to the withholding of grants as a means of forcing men's schools to accept women. Mr. Cope said that it was the making compulsory of what might be brought about by persuasion and example to which they objected.

On the motion of Dr. Waterfield the following motion was adopted:

> That the Council, while welcoming steps to increase the opportunities for medical education for women, regrets the use of financial sanctions to this end and the policy of enforcing co-education in all medical schools.

It was also agreed to set up a small committee to review the Association's Report on Medical Education, 1934, in the light of later developments and the requirements of modern practice.

Organization of Psychiatric Services

Dr. R. G. Gordon presented a report of a joint committee on the future organization of the psychiatric services. He said that the document had the approval of three standing committees of the Association, the Psychological Group of the Association, a special committee of the Royal College of Physicians, and the Royal Medico-Psychological Association. Like all documents of mixed origin, it was somewhat of a compromise, and many people in all these bodies would probably find much to criticize, in both its inclusions and its omissions. The memorandum was approved as a provisional statement of the views of the Association.

Dr. Gordon added that the document had not taken into consideration the work of the Services psychiatrists, and he knew that there was some feeling among them that their new point of view had not had much opportunity of being expressed. It might be that this, with other documents, including one prepared by Dr. C. P. Blacker, would come up for consideration, and the Mental Health Subcommittee of the Negotiating Committee might perhaps be strengthened by certain people who had more knowledge of Service conditions.

The Chairman undertook that this should be considered by the Negotiating Committee.

The Royal College of Surgeons

The Council unanimously agreed that the Association should contribute 1,000 guineas to the Restoration and Development Fund of the Royal College of Surgeons of England.

A letter was received from the Royal College stating that Dr. H. Guy Dain, nominated by the Association, had attended the meetings of the College as representing general practice, and his present period of office ended in June. It invited renomination. Mr. R. L. Newell proposed that Dr. Dain be nominated for a further term of office, and in doing so said that the Council would feel great satisfaction in the relations now existing between the Royal College and the Association. The happy atmosphere, he believed, had been largely created by Dr. Dain himself. Mr. Zachary Cope seconded, and said that the Council would desire to place on record its high appreciation of the action of the Royal College, which had done honour to itself and to the Association by having a nominee of the Association on its Council. The motion was carried with applause, and the Chairman of Council was congratulated on the conferment upon him of the Fellowship of the College.

Miscellaneous Resolutions

On the motion of Mr. A. M. A. Moore, it was agreed that the British Hospitals Association be informed of the resolution of the Annual Representative Meeting, 1943, that there should be representation of the medical staff on the committee of management of all voluntary hospitals.

A further motion by Mr. Moore expressed the view that on retirement from their offices Chairmen of Council, Chairmen of the Representative Body, and Treasurers should remain members of Council for three years, instead of, as at present, for one year. It was agreed that this be referred to the Organization Committee.

The Council had before it a resolution from the Trowbridge Division deploring the failure of the Association to formulate schemes for the interchange of serving medical officers and for the rehabilitation of medical officers on release from the fighting Services. In reply it was stated that the Central Medical War Committee was fully alive to the point. It was also stated that, probably for the next twelve months, demobilization without replacement would not take place on any large scale; officers demobilized would be replaced by others from civil life.

Dr. J. G. Thwaites proposed that the Association should appoint a whole-time officer whose services would be available for demobilized doctors for the purpose of giving them personal advice and assistance in connexion with resettlement. The Secretary said that this would clearly be a job for the medical staff of the Association. If it became too much for them he would report to Council with a view to getting the medical staff augmented. One of the Assistant Secretaries, Dr. Potter, was already doing work along these lines.

Other Business

The Council appointed Mr. Dickson Wright as the Association's representative on the committee of management of the Royal Medical Benevolent Fund; Mr. Zachary Cope as representative on the Council of the Lister Institute of Preventive Medicine; and Dr. R. Gordon Simpson as representative on the National Ophthalmic Treatment Board. The last-named took the place of Mr. N. Bishop Harman, resigned, and an expression of appreciation of his long services in that capacity was conveyed to Mr. Bishop Harman, together with the Council's good wishes and sympathy in his illness.

It was decided to proceed with an application to the College of Arms for a Grant of Arms to the British Medical Association.

The Chairman was authorized to forward on behalf of the Council a suitable letter to twelve honorary secretaries of Divisions and Branches who have relinquished office and whose services were considered deserving of special recognition. Eleven of the twelve had been honorary secretaries of oversea Branches and Divisions. The twelfth was Dr. N. E. Waterfield (Surrey Branch), a member of the Council.

It was agreed to set up a new Building Committee to deal with all questions in connexion with the Association buildings.

After a discussion on the question of medical representation in Parliament and the possible revival of the fund created for this purpose, the officers of the Association and the chairman of the National Insurance Defence Trust were asked to look into the matter and report to the next meeting.

Reports by the Insurance Acts Committee, the Hospitals Committee, the Scottish Committee, the Naval and Military Committee, and the Central Ethical Committee were presented and approved. On the Central Ethical Committee, Dr. Waterfield, the chairman, reported that three old members, all of them former chairmen of the committee, had recently retired—Dr. C. O. Hawthorne, Dr. Langdon-Down, and Dr. A. Lyndon. The Council accorded them an expression of thanks for their long service in this capacity.

The Council passed a resolution expressing the view that the time had arrived for the Government to recognize the Board of Registration of Medical Auxiliaries as an approved body for the registration of such auxiliaries in connexion with any comprehensive medical service.

It was announced that the number of members of the Association was now over 49,000.

A committee was appointed to prepare evidence to be tendered to the Care of Children Committee recently set up by the Ministry of Health.

It was agreed that the Annual Representative Meeting should be held in London on July 24–6 and following days if necessary. The Secretary made a statement on the Special Representative Meeting to be held on the two days following the meeting of the Council. He said that it was at the express request of the Ministry that the *Journal* was not publishing an account of the proceedings, but that arrangements would be made to inform members of the medical profession individually of the course of the discussion and of the decisions of the meeting.

HEARD AT HEADQUARTERS

As Others See Us

Doctors are held in high esteem in this country; but the better liked the individual doctor the more sinister becomes his collective counterpart in the public mind—or at least the public newspaper. The latest example is an article in the *Daily Mirror*, headed in large bold type, "Butchers at the B.M.A.," with the figure of a surgeon armed with a chopper with which he is apparently about to mutilate the White Paper. The text purports to be a description of the recent "secret meetings" in London. Their conspiratorial character is subtly suggested, and there is no reference to the fact that the meetings were secret by instruction of the Ministry of Health and not by design or wish of the B.M.A., and that the same secrecy applies to the meetings of hospitals and of local authorities.

There is the rather surprising statement that "the majority of private practices are held by doctors on mortgages from insurance companies and banks," and this is held to explain why doctors must make money quickly, to pay their interest charges. Once again we have the "devoted service and self-sacrifice of thousands of doctors" pitted against the profiteering spirit of the Association which represents them; this, although the Association is now the virtual embodiment of all the doctors in the country who are in active practice, and their representatives are democratically elected. There is the overworked phrase "Harley Street" to describe the profession: "the B.M.A. is really saying, 'Hands off Harley Street.'"

Dr. Hill for Cambridge

Dr. Charles Hill is to stand as an Independent candidate for the University of Cambridge at the next election. On a recent occasion the Chairman of Council described Dr. Hill as the ablest debater in medical politics. Parliamentary election is always chancy, especially for the candidate who does not wear a party label. But in recent years the universities have shown a tendency to get away from party affiliations and to return Independent candidates. The most recent example is the return of Sir John Boyd Orr for the Scottish universities. Both the Members for Oxford are now Independents, so are both the Members for the English Combined, and the retiring Member for Cambridge prefixes the word "Independent" to his party name, as does the Member for the University of London. Universities have another distinction—that the issue on which the election is fought there is very often different from what it is in the rest of the country. When he first put up for Oxford a hundred years ago Gladstone discovered that, although the country was keen about the Corn Laws, in the university he had to fight his election on a religious question. If Dr. Hill were to join Sir John Orr in the House medicine would be better represented there than it has been for some time past.

A Newcomer

A noteworthy figure at the recent Special Representative Meeting was Lord Horder, who sat as one of the Representatives of Marylebone. Lord Horder has helped the B.M.A. in very many fields, but he has not identified himself closely with its medico-political work, and this was the first occasion, I believe, that he has attended as a Representative. His name was not on the printed list of Representatives, but as Mr. Dickson Wright is a member of Council and was at the meeting in that capacity there was a vacancy in Marylebone, which Lord Horder filled. He spoke twice in the debates: once on the general question of the acceptability or otherwise of the suggested administrative machinery, and again on the retention of the Central Medical Board. His speeches were brief and pointed.

Another representative who has not been heard for some years was Sir Malcolm Watson, who, after having represented Hong Kong and China and Malaya, appeared on this occasion as a Representative for Reading, and brought his long experience of the administration of tropical medicine abroad to bear upon the home problems under discussion.

Pension Disability Rates

The Central Medical War Committee and the Naval and Military Committee of the B.M.A. have been doing what they can to make the rates of retired pay for disabled medical officers more adequate. These rates are thought to be particularly low in the case of officers in the junior ranks with a degree of disability of 70% and upwards. The captain's pension, for instance, is only £168 a year, and the subaltern's £147. At the same time, there are some additional allowances which should be considered. In certain circumstances an allowance up to a maximum of £80 a year may be granted towards a child's education, and if an officer is in need of constant attendance an allowance up to £100 is made for that.

The Ministry of Pensions in its reply to representations from Tavistock Square states that there have been various improvements in the rates since the beginning of the war. The present scale was fixed in 1943. The representations of the Association have been carefully considered, but it is felt that the Ministry would not be justified in recommending any further increase in the rates.

No claim, of course, is being made that there should be any differentiation in the rates to medical officers as compared with officers in other branches of the Forces.

Fees of Public Vaccinators

A revised scale of fees for public vaccinators has been formulated for the West Riding administrative area and has been accepted by the Yorkshire Branch Council of the B.M.A. and approved by the Ministry of Health, which is amending the existing contracts with public vaccinators accordingly. For the guidance of other areas the standardized list is given below:

In respect of births—	
Child entered on list of vaccination officer	2s. 0d.
Not entered on list but vaccinated	2s. 0d.
In respect of vaccination—	
Successful primary vaccination or revaccination at surgery or elsewhere	5s. 0d.
Successful primary vaccination or revaccination at home of person	10s. 0d.
Successful vaccination or revaccination of each additional person at the same time ..	7s. 6d.
Medical officers of institutions who are public vaccinators to those institutions—vaccinations and revaccinations ..	3s. 6d.

Overheard

A Representative at the recent meeting: "All this talk about safeguards for private practice is simply eyewash and a red herring drawn across the track. If we are not careful it will sell the pass for us."

"Doctor"

Evidently a good many medical men have decided to keep the "Doctor" labels on their windscreens until the end of the Japanese war. Why wait?

Correspondence

Medical Training

SIR,—Mr. McCurrich (*Supplement*, May 5, p. 74) has a good deal to say with which I agree, but when he says, "At present G.P.s are trained entirely by consultants, who, as a rule, have never been in general practice," I consider he is quite wrong. All the successful doctors I know (I use the term in preference to that of G.P. preferred by specialists) have learned their job from doctors, or by the harder method of trial and error.

For myself I was assistant for three years to Dr. Holmes, of Heanor, Derbyshire, who taught me more about general practice than I ever learned in a medical school. Since then I have had about a dozen assistants, and none of them has left me without learning something—some of them a great deal. Anyone who thinks general practice can be learned in a hospital or postgraduate school has a great deal to learn about it.—I am, etc.,

Wrose, Shipley. H. S. RUSSELL.

Regional Medical Service

SIR,—Dr. A. W. Weston's reference (*Supplement*, April 28, p. 72) to the return of the inquisitions of regional medical officers deserves comment. Do the advocates of 100% State medical service know all about this inspection, which clearly would become more frequent (say, monthly) once we become completely dependent on the State? Do they know that even in pre-war days one was liable to be asked why one prescribed a little over "the odds"?—I am, etc.,

Chipping Norton. J. P. O'SHEA.

BRITISH MEDICAL ASSOCIATION

ANNUAL REPRESENTATIVE MEETING, LONDON, 1945

The Annual Representative Meeting of the B.M.A. will be held at B.M.A. House, Tavistock Square, London, W.C.1, commencing at 2 p.m., on Tuesday, July 24, and will continue on Wednesday, July 25, Thursday, July 26, and following days if necessary.

CHARLES HILL,
Secretary.

Branch and Division Meetings to be Held

EAST YORKSHIRE BRANCH.—At City Restaurant, Lowgate, Hull, Wed., May 23, 8.30 p.m., annual general meeting. Presidential address by Dr. C. Simpson: Beyond the Microscope.

WINCHESTER DIVISION.—At Nightingale Home, Royal Hampshire County Hospital, Winchester, Wed., May 23, 2.45 p.m., Dr. Harold Balme and Brig. T. H. Wand-Tetley: Rehabilitation and its Relation to Post-war Medical Services.

CONSULTANT AND SPECIALIST OPINION

Liverpool.—A joint meeting of the British Medical Association Consultants and Specialists Group and the Liverpool Hospital Staffs Association will be held at the Liverpool Medical Institution, Mount Pleasant, on Wednesday, May 23, at 4.30 p.m. All consultants and specialists in the area are invited.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1) Week-end course in thoracic surgery, at Harefield Hospital, all-day, Sat. and Sun., May 26 and 27; (2) Week-end course in diseases of women, at Elizabeth Garrett Anderson Hospital, all-day, Sat. and Sun., June 2 and 3; (3) Week-end course in ophthalmology at Royal Westminster Ophthalmic Hospital, all-day, Sat. and Sun., June 9 and 10; (4) General surgery, at North Middlesex Hospital, all-day, Sat. and Sun., June 16 and 17; (5) Ear, nose, and throat, at Metropolitan Ear, Nose and Throat Hospital, all-day, Sat. and Sun., June 30 and July 1. Further particulars can be obtained from the Fellowship of Medicine, 1, Wimpole Street, London, W.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*Harefield Hospital:* All-day, Sat. and Sun., May 26 and 27, week-end course in thoracic surgery.

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m.; Dr. C. E. van Rooyen: Infective Hepatitis.

GLASGOW UNIVERSITY: DEPARTMENT OF OPHTHALMOLOGY.—*Wed.*, 8 p.m., Dr. R. W. Pickford: A New Approach to Defects of Colour Vision.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—*Fri.*, 4 p.m., Prof. A. Sorsby: Blindness in Great Britain: the Structure of the Blind Population and the Causes of Blindness.

ROYAL SOCIETY OF MEDICINE.—*Thurs.*, 4.45 p.m., Sections of Urology and of Obstetrics and Gynaecology; 5 p.m., Section of Psychiatry. *Sat.* (May 26), 3.15 p.m., Section of Disease in Children.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. *for* 18 *words or less. Extra words* 3s. 6d. *for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.*

DEATH

DUNCAN.—On April 25, 1945, Cyril Duncan, *M.C.*, M.B., of "Lyndhurst," Chester-le-Street, aged 54 years, only son of the late David Duncan, M.B.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY MAY 26 1945

MEDICAL DEMOBILIZATION AND RESETTLEMENT

The following letter is now being sent by the Central Medical War Committee to all medical officers serving temporarily in the Forces.

DEAR SIR OR MADAM,

This letter is written to you, and to all your medical colleagues serving temporarily in the Forces, with the object of explaining what we, in the Central Medical War Committee, are doing and planning in connexion with your release from service and resettlement in civil life.

What many of you are thinking and feeling about these things, especially those of you with long service over-seas, is fully appreciated. For years you have endured separation from your homes and families. For many of you the years have been largely wasted so far as gaining clinical experience is concerned. If you were recruited a few months after qualifying you may have to relearn your medicine before you start in practice. How, you ask, are you to do it? If you are now married, how can you afford to do it?

Perhaps you left a general practice which has dwindled sadly in your absence. You are anxious to get back to save what you can from the wreck, although you may well need a clinical "brush-up" first. You know that many G.P.s who are liable and fit for service, and perhaps younger than yourself, have never been called up. Now, possibly, you have received notice of posting to Burma. Does this mean that your hope of being released when your turn comes must be altogether abandoned? If so, what justice is there in this, when there are so many at home who could replace you?

If you had your foot on the first-rung of the ladder leading to consultant practice, how are you to get it back there? What prospects will you have in competition with those who have remained at home and taken the higher diplomas? And why cannot you be allowed to get on with your career now? Why not let the "stay-at-homes" in the E.M.S. and elsewhere get into uniform and give you a chance to get out of it?

You may have been in one of the public services and may have anticipated that in the normal course you would have secured advancement to a more important post. You may perhaps think that with increasing age your prospects of such advancement are diminishing. Will those who have remained behind have secured, or have a better chance for, all the good posts?

We realize that such questions have been troubling many of you, and although some of your criticisms seem based on insufficient information or even conjecture we want you to know that our sympathies are entirely with you and that it is our sincere intention to do everything we can to help you. We cannot solve all your problems. We cannot restore to you the lost years, nor even arrange equal shares of sacrifice for all. You will not expect that. What you rightly expect is that, so far as lies in our power, we shall prevent any avoidable addition to the hardship you have already suffered and see that you get a fair deal in regard to release, re-education, and re-employment.

Release

You know about the Government's re-allocation of man-power scheme, under which releases will be arranged in groups determined by age and length of service. These releases (Class A) will be possible partly owing to a reduction in the strength of the Forces, but partly also as a result of continued recruitment. The White Paper states that one of the objects of continued recruitment is "to increase the releases in Class A." In short, the release plan involves an element of replacement. The plan provides also for the retention of a member of the Forces, where necessary for military reasons, beyond the date on which his age-service group is due for release.

When a start has been made with Class A releases arrangements will be made for the transfer to civilian employment, out of their turn and with their consent, of a limited number of members of the Forces whose services are urgently needed for work of national importance (Class B). *The number of Class B transfers will be small in proportion to the number of Class A releases.* Persons transferred will not enjoy the same benefits as those released. They will be liable to recall to the Forces if they leave the work for which they were transferred, and they will receive only three weeks' leave with full pay in place of the eight weeks granted to those in Class A. Arrangements for compassionate release and for discharge on medical grounds will continue as at present.

No doubt hard cases will occur, but it is generally agreed that the reallocation scheme is as fair as any such scheme could be. We believe that if the Government's plan can be made to apply to doctors as to other members of the Forces you will not ask for more than that. Indeed, we think that, even if the plan could not work completely for doctors, you would accept that position without complaint if you were convinced that we had done everything possible to make it work.

The Difficulties

What, then, are the difficulties? First, the medical requirements of the Forces for the war in the Far East will be such as to make impossible a reduction in strength of the medical branches proportionate to the reduction in strength of other branches. It follows that the replacement element must enter more largely into the arrangements for the release of doctors than into the general release plan; otherwise, a disproportionate number of doctors will find their return to civil life delayed on the ground of military necessity. *In short, the key to the problem of releasing Service doctors lies in the recruitment of civilian doctors.* But it is not merely a question of finding a sufficient total number of new recruits. A large proportion of the medical officers with a high release priority in Class A are senior specialists. If they are to be released in their turn many junior specialists will be needed to replace them. We must therefore find recruits both sufficient in numbers and with the requisite experience in the various professional categories.

Finally, the problem is complicated by the Class B transfer arrangement, which will be a continuation of the present procedure for release on the ground of urgent civil need. We think that a number of medical teachers will have to be transferred in Class B in the interests both of undergraduate teaching and of postgraduate instruction of released Service doctors. There will be others whose transfer in Class B will be urgently necessary—general practitioners, for instance, and tuberculosis officers. And for each officer transferred a doctor will have to be recruited. Our task, then—apart from any necessary continuation of the ordinary recruitment now proceeding—will be to find a large number of recruits, including many junior specialists, to facilitate Class A releases; and still more recruits to compensate for Class B transfers.

Present Recruitment Policy

Meantime we are sending to the Forces every man and woman who can be spared. The main source of supply is the pool of young practitioners who have completed A or B2 posts[1] in hospitals. We are continually rejecting applications from these practitioners for further deferment. We rarely allow them, for example, to accept even short-term engagements in general practice, although we receive many urgent appeals for their services as assistants; nor do we grant deferment to enable them to take examinations for higher degrees or diplomas. Because of the importance of keeping up a sufficient flow of recruits to the Forces we examine with great care the applications from hospitals for additions to their establishments of house officers. For the same reason we refuse to sanction new appointments of other kinds, however important, unless they are absolutely necessary in the public interest. We keep a watch on appointments to medical posts over-seas. We are doing all this at the cost of very heavy strain on the already dangerously depleted civilian medical services. Many of your colleagues at home are carrying almost intolerable burdens, and there are some, both old and ill, who in truth are being worked to death.

We have spent much time in a laborious examination of the general practitioner position throughout the country, the results of which prove conclusively the impossibility of obtaining further recruits from this source until releases of general practitioners from the Services can take place. The public health medical services have been drastically curtailed. The Ministries of Health and Education, by control of appointments, have effected numerous economies in staffing, and these services are now operating under considerable difficulties. The E.M.S. unfortunately is not the limitless reservoir of potential recruits so often pictured in letters from the battle-fronts. It is staffed largely by part-time consultants—many of them above military age—with other important commitments.

It is true that in the hospital service as a whole, although not mainly in E.M.S. hospitals,[2] there is a considerable number of whole-time residents of the B1 category. Some of these are medically unfit; others are senior members of municipal hospital staffs, comparable in status with the visiting staffs of voluntary hospitals and irreplaceable at the present time; others again, although younger, have had to be retained because of the difficulty of finding sufficiently experienced substitutes, particularly for those engaged in more specialized work such as neurosurgery and plastic surgery. There has been, however, a continuous flow of B1 officers to the Services, and every effort is now being made to obtain additional B1 recruits; but there is no doubt that until the return of men from the Forces begins we must continue to depend mainly on the young practitioner pool. It should be recognized that medical officers retained in civilian practice have made a valuable contribution to the war effort in the treatment of Service sick and wounded and of air-raid casualties and in other ways, and that their retention in this country has for the most part not been a matter of personal choice.

---

[1] "A" posts are occupied for 6 months by newly qualified practitioners, a proportion of whom then pass on to "B2" posts, which call for previous professional experience and are normally held for 6 months only. Similarly, a number of young practitioners, on completing "B2" posts, are appointed to senior resident posts—such as that of R.S.O.—designated "B1." The duration of "B1" posts varies. Some "B1" officers are recruited when they have held their posts for one year; the others are recruited, whenever possible, after two years.

[2] In the E.M.S. in England and Wales there are at present approximately 110 "B1" officers, liable and fit for military service, who have held their posts for two years or longer; and about half as many again who have held their posts for one year but less than two years.

Future Recruitment Policy

So much for the present position. What of the future? When the reallocation scheme comes into operation the regular supply of young practitioner recruits will still continue. Our aim then will be to arrange the necessary replacement of officers released and transferred by recruiting not only young practitioners but doctors in all forms of medical work whose continued deferment will be rendered unnecessary by the return of colleagues from the Forces. No class of practitioner will escape our attention. We shall call up younger general practitioners at present considered indispensable and younger consultants on the staffs of voluntary hospitals. So that this may be possible, it has been recommended to the Government that the limit of age for continued recruitment of doctors should be between 35 and 40, although the Government have announced that recruitment generally will proceed only up to the age of 25 or, if necessary, 27. We have every hope that the Government will accept this recommendation. The replacement of returning specialists will be arranged by the recruitment both of young consultants and of the B1 officers referred to above, many of whom are of graded specialist status.

Transfers in Class B will be recommended only in circumstances of urgent necessity. At present we reluctantly reject many appeals for release on the ground of civil need which we should much like to support. We shall continue to scrutinize all such applications with great care and approve them only when a very strong case has been established. Class A releases will be our first concern.

We are determined to do everything possible to ensure that retention of individual medical officers because of military necessity is kept minimal. We think that, even if you are now bound for Burma, you need not conclude that you will have to stay there beyond the proper date for your release. Our task is certain to be difficult, but we have no reason to believe that the difficulties will prove insuperable. We promise that, by every possible means of recruitment, we shall do our utmost to see that both repatriation and release take place at the appointed times.

Postgraduate Training

Credit is due to the B.M.A. for having urged the Government, so long ago as the autumn of 1941, to arrange suitable postgraduate training facilities for medical officers in need of professional re-education on release from the Forces. More recently we have done our best to reinforce the efforts of the B.M.A. The Government have now announced their proposals, and we understand that details are being issued through Service channels for the information of all serving doctors.

The plan provides for three classes of medical officers. Class I comprises those who joined the Forces within a year or so of qualification. If you are in Class I you will probably wish to obtain some further hospital training. We thought that you would welcome something more than a course of lectures and demonstrations or an opportunity of attending the practice of a hospital as a clinical assistant. We recommended that you should be given a responsible hospital appointment at a suitable salary. The Government's plan offers you a post of the junior B1 category for a period up to six months. If you were recruited after obtaining a diploma and wish to proceed to a university degree, you will be placed if possible in a teaching hospital. You will be paid at the rate of £350 a year, with board and lodging or an allowance in lieu at the rate of £100 a year. This is not generous pay for a man with family commitments, but such a man may apply for financial assistance under the "Further Education and Training Scheme" arranged by the Ministries of Labour and Education for ex-Service men and women generally. We tried to get a considerably higher salary for you, but we hope that this plan for supplementing the salary when necessary will mean that no man will be prevented from accepting one of these posts for financial reasons. A Class I officer studying for a qualification such as the D.P.H. and not holding a salaried post may apply for a grant under the Further Education and Training Scheme.

Class II consists of those who were established in general practice before joining the Forces. If this is your position you will be offered a refresher course, which you may take at any time within a year of your release. No fees will be charged; and travelling and subsistence expenses will be refunded by the Ministry of Health, together with the expense of paying a locum where necessary. The courses may be either concentrated into a period of two weeks or spread over a period of about three months on, say, two afternoons a week. Here again the plan falls short of what we wanted. We strongly recommended that you should be offered a longer course, but the length proposed is all that the Government consider practicable.

In Class III will be those medical officers who were training for a specialist career when they joined the Forces or are regarded as suitable for such training on their release. For them there will be posts of the "registrar" type in teaching and other hospitals. These will usually be posts in the senior B1 category at a salary of £550 a year with board and lodging or £100 in lieu. Many of them will be new posts, specially created to facilitate your specialist training.

All the arrangements will be made by the universities in accordance with the long-term policy for postgraduate medical education recommended in the Goodenough report. If you wish to avail yourself of the facilities offered you should apply, on your release, to your university or medical school, or to the university nearest to where you are living, or to one of two central offices to be set up in London and Edinburgh. Further details will be announced later. Some Class III officers gained higher diplomas before they were recruited or have done so while serving, but many have had no opportunity of taking the examinations. We are asking the Examining Bodies to consider the possibility of modifying the existing examination regulations for candidates now serving over-seas, and in particular to do everything possible in the way of recognizing a candidate's medical work on service as satisfying the requirements for admission to the examinations.

Senior Appointments

In 1939 the B.M.A. urged all hospital authorities to adopt the policy of making appointments to the consultant and specialist staffs on a temporary basis during the war and for one year thereafter. We believe that this is the right policy, although we are well aware of the fact that it does not completely protect the interests of the Service doctors. The B.M.A. recommendation has been adopted to a very large extent. So far as voluntary hospitals are concerned, even temporary appointments of younger men to the visiting staffs have been infrequent, for such appointments would usually be made by promotion of B1 officers, and our policy has been to recruit these officers on the termination of their B1 posts. It recently came to our notice that a considerable number of permanent appointments had been made to senior posts in the mental hospitals service. We have made representations about this to the Board of Control and the Mental Hospitals Association.

It has been the consistent policy of the Ministry of Health to encourage local authorities to make temporary appointments, and since May, 1943, the filling of vacancies in the public health and school medical services has required the approval of the Ministry of Health, which sanctions a permanent appointment only in the most exceptional circumstances and has not in fact sanctioned any permanent appointment of a senior nature during the past two years. A similar policy has been adopted by the Department of Health for Scotland.

While we think that a permanent appointment may be justified in exceptional circumstances, we have suggested to the B.M.A. the desirability of repeating its 1939 recommendation at this stage, and of urging that, when a permanent appointment is regarded as necessary, the time allowed for the receipt of applications should be such as to permit of candidates serving in the Forces over-seas being considered. The B.M.A. is acting on this suggestion. We have considered the possibility of recommending rejection of advertisements of permanent appointments not available to Service doctors, but we are advised that legal considerations make this impracticable.

Summary

To sum up—we believe that the fair way of arranging the release of medical officers is the way proposed by the Government for the Forces as a whole. In the special case of medical officers a disproportionately large number of new recruits will be required to enable releases to be effected in accordance with the Government's plan. For this reason we hope to obtain authority to continue recruiting civilian doctors up to a limit of age between 35 and 40. Our intention is to call up not only the recently qualified practitioners but also many older practitioners (including general practitioners, junior consultants, and B1 hospital officers) who cannot be spared at present but will become available in exchange for returning Service doctors. We shall do our utmost, by the widest possible measures of recruitment, to facilitate both repatriation and release at the proper times. We have tried to secure for you a generous provision of postgraduate facilities, and we hope that the Government's proposals will go a long way towards meeting your need for further professional training, although in some respects they fall short of what we asked for on your behalf. We are doing what we can to promote your interests in connexion with higher examinations and senior appointments. We shall welcome any practicable suggestion as to how we can do more.

Yours faithfully,
(Signed) CHARLES HILL,
Secretary.
Central Medical War Committee.

The Ministry of Health announces the re-establishment of the Insurance Regional Medical Service, though for the present this will be on a restricted scale. It is now open to insurance practitioners to refer cases for examination, and references should be sent to the appropriate insurance divisional medical officers, whose addresses are as follows:

North-Eastern Division: Century House, South Parade, Leeds, 1. (Tel.: Leeds 30464.)

North-Western Division: The Baptist College, Brighton Grove, Manchester, 14. (Tel.: Rusholme 3248.)

South-Eastern and South-Western Divisions: Queen Anne's Chambers, 28, Broadway, Westminster, S.W.1. (Tel.: Whitehall 7010.)

HEARD AT HEADQUARTERS

"Helots"

In delivering the annual oration to the Medical Society of London the other day Dr. F. M. R. Walshe permitted himself an observation on the external affairs of medicine as compared with the internal affairs—the changing thoughts and ideals —which were his main theme. He described the cause of the external "crisis" in medicine as the increasingly authoritarian trend of Government—a trend, he said, which might well, by the slowly acting weapon of economic starvation, direct them all into a State medical service. In his view this would be to deprive them of the full measure of civil liberty they had enjoyed under the Common Law, and at the same time to deprive them of some measure of intellectual liberty as well. He acknowledged that there had been great human achievements in the absence of liberty—he mentioned John Bunyan in gaol, Galileo in the custody of the Inquisition, and Ovid in penal exile—but, he said, he had yet to learn that a helot had ever contributed to human thought, and helots they would certainly be if what he had just foretold were brought to pass.

Dr. Walshe then turned to less disturbing themes, and the president, with a smile, said it was as well that he had done so, as otherwise he might, as the guardian of the Society's traditions, have had to rule Dr. Walshe out of order.

An Old Innuendo

It is regrettable to see in a paper of the type of the *New Statesman and Nation* the old familiar statement, which becomes no more true by repetition, that "the continuance and extension of the panel," which the writer of the article takes to be the result of the modified health scheme now shaping, "means the continuance of two types of patient—the private, who enter by the front door and are seen at once, and the public, who go in at the back and have to wait long periods." And "two types of patient," it is added, "mean two types of treatment."

This insinuation about the difference between the treatment of private and of "panel" patients has been made so often that it is really time those who make it should be asked for facts and figures in evidence. It is true that in the history of National Health Insurance there have been occasional complaints on this ground brought before insurance committees. Their rarity compared with the vast extent of insurance practice has been their distinguishing feature.

One emphatic statement was made from the platform at the recent Special Representative Meeting. "I cannot give my private patients a better service than I give my hospital patients." The speaker was the President of the B.M.A., and therein he spoke for its members, that it is against the conscience, the habit of mind, the instinctive reaction of the doctor towards his patient to make this distinction. As another speaker said, the patients should not be described as "public" and "private," for all of them are private in the important sense that the treatment is given privately, that it is the best treatment the doctor can give, and that the confidence of the doctor-patient relationship is respected.

The Proportion of Specialists

In the United Kingdom in the early part of 1944, according to figures got out by the B.M.A., there were 3,482 consultants and specialists in the United Kingdom and 16,937 general practitioners. These figures leave entirely out of account whole-time officers in the service of hospitals or of local authorities. It is curious that a country like Canada has a larger proportion of specialists. There are 1,437 whole-time consultants and specialists in private practice in Canada, and 5,894 general practitioners. This again excludes all those holding whole-time appointments in the public or hospital service. In Quebec there is one specialist to a fraction over three general practitioners. Of the 1,437 whole-time specialists in private practice in Canada the largest category (387) consists of ophthalmologists, otologists, and laryngologists; obstetrics and gynaecology account for only 121, anaesthetics for 43, and dermatology for 36.

In the United States, apparently, there has been in recent years an extraordinary increase in the number of specialists. A publication of the American Committee of Research in Medical Economics observes that in 1942 more than 50% of the doctors in the United States were engaged either whole-time or part-time in some specialty, compared with only 25% in 1928.

The Doctor's Influence

At a public meeting in London the other day a professor (not of medicine but of engineering), who was talking of the new respect paid to science, declared that eighty years ago when a doctor called at the house he was customarily shown in at the back door. He did not quote any authority for that statement, and I cannot think it is accurate, except perhaps in the case of a doctor called to attend the servants at the houses of the great. By the middle of the last century the family doctor—no longer spoken of as "the 'pothecary"—had become a most important and much-respected member of the local community and exercised a good deal of influence in local affairs. Nevertheless, it is true, as is pointed out in the Charter for Health which is shortly to be published by the B.M.A., formerly doctors had little contact with national life; they worked in isolation, and their influence in the shaping of legislation or of social custom was not great.

To-day, as the Charter says, they are in close and constant touch with the general affairs of the people, and the views of the medical profession on health matters carry weight in Parliament and in local councils, on the radio, in the Press, and in inquiries and reports on specific subjects. The doctor thus becomes the health adviser not only of his individual patient but of the community and of the nation.

This collective function of doctors as national health advisers is a recent development and promises to become an increasingly valuable asset to the people. Is it borne in mind by the ordinary citizen that doctors collectively by guiding medico-sociological developments can prevent the health of the people from being sacrificed to political interests?

The Association's House

It is twenty years ago this early summer that the B.M.A. building in Tavistock Square was opened by King George V and Queen Mary. The move from the Strand to Tavistock Square was considered a big venture at the time and some shook their heads over the financial responsibilities entailed. The building then, of course, was not as extensive as it is now. The Great Hall was there, on which Lutyens had spent his genius, and extensions north and south completing the main courtyard. But it was not until after the Association had settled in that the buildings west of the memorial gates were constructed, and the open quadrangle converted into a closed court approached by the archway under new buildings which now carry on the continuous alignment of Tavistock Square and Upper Woburn Place. Those who conceived this plan, the chief of them the late Sir Robert Bolam, then Chairman of Council, built not only for dignity and working efficiency but, as it proved, for financial prosperity.

This was shown in the financial statement presented by the Treasurer (Dr. J. W. Bone) at the last meeting of Council. The building has proved a good investment, bringing in an excellent dividend. The total revenue of the Association and the *Journal* now approaches a quarter of a million, and the income from members' subscriptions alone exceeds £100,000.

Correspondence

Health Centres and the Scientific Method

SIR,—Dr. L. Phillips asks the question (*Supplement*, March 24, p. 45) why I should single out health centres when the argument as to inconvenience to patients applies equally to grouped private practices (*Supplement*, Jan. 6, p. 1). Two reasons can be advanced: (1) that grouped private practices are not concerned in any way with morbidity data; and (2) health centres will be the development of a Government policy which will interfere with the freedom for research in general practice by the general practitioner.

The research worker requires to know the rules of the "scientific method." In a comprehensive service the scientific method of dealing with data and the experimental method of studying phenomena are essential. In social science those methods include the observation, the classification, and the interpretation of data for the purpose of prediction and the application of the derived knowledge for control. The general design is the same whether it is carried out by an individual or by an organization with functions delegated to different individuals.

I have been a student of the methods for many years, and latterly have utilized my panel as "a sample of a universe" for the investigation of social problems. Data have been collected, integrated by mechanical methods, and analysed; hypotheses have been developed, experiments have been designed, data collected, and hypotheses tested, and so on. This should explain why I have taken an interest in the intentions of the Ministry concerning this essential part of a National Health Service.

For the development of social medicine two schemes can be adopted. (1) The organization of investigations with general practitioners acting simply as field workers but with centralized control and direction. The integration and analysis would be functions of that "Institute of Statistics" which, in a memorandum to the Government, the Institution of Professional Civil Servants is urging should be founded at an early date. (2) The development of the panel as a statistical unit with general practitioners trained in the scientific and experimental methods. Those practitioners would fill the dual role of field workers and investigators. In this scheme the Institute of Statistics would act only in an advisory capacity, assisting the general practitioner in the design of his experiments, analysing his data, and generally co-ordinating the whole field of research. The second scheme must appeal to any general practitioner who, having been trained in the scientific method, wishes to investigate the problems of the routine work of his practice. The first scheme, however, would be the natural policy of a Government Department responsible for administration and familiar with the problems of a census.

Both schemes must be experimental, both can be justified scientifically, and both should be given a chance. It would appear, however, that it is only the first scheme which is receiving official support, and that health centres will simplify the administrative problems of such a scheme. The evidence for this intention will be found in the report of the Goodenough Committee. While it emphasizes the need for the student to be trained in the scientific method (p. 166, para. 54), it lends its full support to the first scheme by stipulating that medical students must become familiar with the M.R.C. coding of morbidity (p. 135, para. 29).

The success of either scheme depends on mechanical methods for the integration and analyses of data. The M.R.C. code (Spec. Rep. Ser. No. 248) has been prepared so that the Powers tabulating machinery can be used for this work, and the code will also be required in the experimental work of investigations. The system is already in operation in the Health Surveys of the Ministry (*M.O.H. Monthly Bulletin*, April, 1944). It is also that of the Oxford Bureau.

I would have used punch cards and the Powers tabulating method as early as 1920, but the cost of hire was, and still is, prohibitive. One or two of a specialized staff would have been required to code the data. It is not a method which a panel doctor can afford to use. Therefore, while the general practitioner must do the field work, he is not to be the investigator. The second scheme has had the advantage of enabling me to design my own experiments, to see the processes develop, and thus maintain an interest and enthusiasm which the mere "cog" in a State-controlled machine can never hope to have.—I am, etc.,

Halifax. A. GARVIE.

Medical Demobilization

SIR,—With the fixing of VE Day, we know that demobilization will commence in 42 days' time. All Army officers and other ranks are to be released according to their age and length of service; not so the doctors, dentists, chaplains, and certain specialists, who can only be released on the direct instruction of the War Office. As with the rest of the Forces, our releases will be under two classes—Class A, according to age and length of service, and Class B, who are the "special releases."

At first sight this appears equitable enough, and, in fact, will be so if the releases under Class B are the exception rather than the rule. However, the system under Class B is open to abuse, and unless definite restrictions are placed on the number of such releases it appears highly probable that most releases will be under this class for the following reason. We all realize that the civilian population are very short of doctors, with the result that almost every town and village through the Local Medical War Committee will be calling for the immediate release of the doctors previously practising in that area. If these requests are acceded to, the younger and generally longer-serving medical officers who have never been in practice will find themselves retained in the Services, while other medical officers with a much shorter term of service are released. To say the least of it, such an occurrence would be grossly unfair to the former. The silence maintained in this matter of releases of doctors by both the War Office and the B.M.A. has, to me at any rate, a slightly sinister significance, in that there is no hint or suggestion as to the length of time we may be retained after our age and service group has been released.

On behalf of the long-serving (and long-suffering) medical officers, many of whom have a wife and family but no home or practice to return to, may I plead that Class B releases be restricted to the barest minimum, and the very large majority of us are demobilized according to our age and length of service. For obvious reasons I must ask to remain anonymous.—I am, etc.,

"CAPTAIN, R.A.M.C."

⁂ As will be seen from the letter of the Central Medical War Committee which is published in this issue (p. 95) it is intended that the release plan on the basis of age and length of service shall apply to doctors as to other members of the Forces, and there can be no question of most releases being in Class B. As for the alleged silence regarding the position of doctors under the reallocation scheme, explanations have appeared repeatedly in the *Journal*.—ED., *B.M.J.*

H.M. Forces Appointments

ARMY

Col. (acting Major-Gen.) J. C. A. Dowse, C.B.E., M.C., late R.A.M.C., to be Temp. Major-Gen.

Lieut.-Col. E. G. S. Cane, D.S.O., has ceased to be employed on account of disability, and has been restored to the rank of Col.

Short Service Commission.—Capt. D. N. Parry has retired on account of disability, and has been granted the honorary rank of Major. (Substituted for the notification in a *Supplement* to the *London Gazette* dated April 3.)

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Capt. (Brevet Major) K. L. O'Sullivan has relinquished his commission on account of disability, and has been granted the honorary rank of Major.

WOMEN'S FORCES

EMPLOYED WITH THE MEDICAL BRANCH OF THE R.A.F.

To be Flying Officers (Emergency): Catherine P. Cathcart and Joan S. Deans.

INDIAN MEDICAL SERVICE

Lieut.-Col. S. L. Patney has retired.

Capt. D. P. Nath to be Major. (Substituted for the notification in the *London Gazette* dated June 14, 1940.)

EMERGENCY COMMISSIONS

Capt. O. J. S. Macdonald to be Major.

The initials of Capt. E. J. Rubra are as now described and not as stated in the *London Gazette* dated Feb. 18, 1944.

COLONIAL MEDICAL SERVICE

The following appointments are announced: A. McKelvie, M.B., Medical Officer, Nigeria; J. N. P. Davies, M.B., Medical Officer, Uganda Protectorate: J. C. Chartres, B.M., B.Ch., Medical Officer, Nigeria; E. G. Laurence, M.R.C.S., L.R.C.P., Ophthalmologist, Trinidad; A. J. Boase, M.R.C.S., L.R.C.P., Ophthalmologist, Uganda; J. C. R. Buchanan, M.D., Inspector-General of South Pacific Medical Services; H. C. Trowell, M.D., Physician, Uganda; V. L. Sutherland, M.B., Ch.B., Assistant Medical Officer, Jamaica.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1 M.R.C.P. course in neurology, Mon., Tues., and Fri., 2.30 p.m., from June 4 to 29; (2) Week-end course in ophthalmology, at Royal Westminster Ophthalmic Hospital, all-day, Sat. and Sun., June 9 and 10; (3) Week-end course in general surgery at North Middlesex Hospital, all-day, Sat. and Sun., June 16 and 17; (4) Week-end course in ear, nose, and throat diseases, at Metropolitan Ear, Nose and Throat Hospital, all-day, Sat. and Sun., June 30 and July 1.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*Elizabeth Garrett Anderson Hospital:* all-day Sat. and Sun., June 2 and 3, Week-end course in general medicine (for women postgraduates only).

GLASGOW UNIVERSITY: DEPARTMENT OF OPHTHALMOLOGY.—*Wed.*, 8 p.m., Mr. W. B. Inglis Pollock: Arabian and Mediaeval Ophthalmology.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—*Tues.*, 4 p.m., Prof. A. Sorsby: Penicillin and Gramicidin S in Ophthalmology: *Thurs.*, 4 p.m., Mr. James Patrick: A Study of Supination and Pronation, with Special Reference to the Treatment of Forearm Fractures.

ROYAL SOCIETY OF MEDICINE.—*Mon.*, 4.30 p.m., Section of Odontology. *Tues.*, 5 p.m., Section of Medicine; 5 p.m., Special meeting of Fellows. *Fri.*, 1.30 p.m., Section of Epidemiology and State Medicine: 10.30 a.m., Sections of Laryngology and of Otology.

B.M.A.: Diary of Central Meetings

JUNE

13. Wed. Council, 10 a.m.

B.M.A.: Branch and Division Meetings to be Held

HEREFORD DIVISION.—At Garrick A.R.P. Post, Widemarsh Street, Hereford, Fri., June 1, 4 p.m. Mr. F. Selby Tait (Birmingham): Ante-natal and Post-natal Care.

KENSINGTON DIVISION.—At British Postgraduate Medical School, Ducane Road, W., Fri., May 25, at 8.30 p.m. Annual meeting of the whole profession in the area to elect Local Medical War Committee. The annual meeting of the Division will follow at 9 p.m.

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Queen's Hotel, Alderley Edge, Wed., June 6, 8.30 p.m. Dr. G. Stewart Smith: Penicillin Treatment.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. *for* 18 *words or less. Extra words* 3s. 6d. *for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.*

BIRTHS

GARDHAM.—On May 15, 1945, at 40, Acacia Road, St. John's Wood, N.W.8, to Audrey (*née* Carr), wife of John Gardham, F.R.C.S., a daughter.

HAMER.—On May 15, 1945, at Allington House Nursing Home, Ipswich, to Mary (*née* Carley) and Capt. J. M. Hamer, R.A.M.C. (Overseas), a son (Andrew Charles).

WARD.—On May 7, 1945, at Queen Elizabeth Hospital, Birmingham, to Dr. Elizabeth Ward (*née* Mackay) and Squad. Ldr. J. A. Ward, R.A.F.V.R., a son.

MARRIAGES

HERD—PATERSON.—At Edinburgh, on May 7, 1945, James Herd, M.B. (Aberdeen), to Edith Paterson, of Innerleithen.

SCOTT—GOUGH.—On May 9, 1945, at the Parish Church, Wincanton, Col. Ernest Scott, youngest son of the late Mr. and Mrs. J. B. Scott, of Caterham, Surrey, to Marguerite, second daughter of Mr. W. H. Gough and the late Mrs. Gough, of Dorlangoch, Brecon.

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY JUNE 2 1945

HEARD AT HEADQUARTERS

The Labour Party's Health Policy

The Labour Party, during its week's conference at Blackpool, dismissed the National Health Service proposals in less than half an hour. There were several resolutions and amendments on the paper, one of them, by the South Paddington division of the party, "viewing with great apprehension the recent activities of the British Medical Association," and declaring that all attempts to achieve a satisfactory National Health Service "will be defeated unless the vested interests of the medical profession are subordinated to the needs of the people."

This resolution, however, was not taken, and, following the usual procedure of the conference, a composite resolution was framed which secured unanimous assent. This resolution—one of the longest submitted to the conference—began by regretting that the Minister of Health was contemplating radical alterations in the scheme, violating democratic principles, and sacrificing the health of the people to the vested interests of the medical profession. It went on to declare that no scheme can be acceptable which does not give the local authorities control over municipal hospitals and medical services on statutory health councils and committees, which does not put an end to the National Health Insurance "panel" service "with its one standard of service for the poor and another for the rich," which does not give the local authorities the power of initiation and control of health centres, which does not abolish the buying and selling of practices paid for by public funds, which does not provide for the training of doctors by using the municipal hospitals and by making medical education free to all suitable candidates irrespective of sex, and which does not include the National Health Service as part of the comprehensive social security plan.

The conference called upon the Government to implement by legislation nothing less than the proposals of the White Paper. One would have thought that in a week's conference, concerned mostly with domestic and social questions, with an eye on the General Election and on Labour's programme for the new Government—which will be a Labour Government according to all the Blackpool forecasts—more time than half an hour would have been allotted to such sweeping proposals. The proposer of this omnibus motion, Dr. Stark Murray, was given no more than five minutes. He had time only to declare that the "Not for publication" document had completely destroyed all hope of a National Health Service. The whole episode of these secret negotiations, he said, was an example of how privilege would protect itself.

It was left to Dr. Edith Summerskill, M.P., who, as a member of the National Executive, was not subject to the time limit for speakers on the floor, to carry on from the point at which Dr. Stark Murray stopped. She described the procedure which had developed between the Minister of Health and the B.M.A. as a gross betrayal of the public interest. It was evident, she said, that the Conservative Party had no intention of implementing the promises embodied in the White Paper, and the "old guard" of the medical profession was obstructing progress just as it had done at the outset of National Health Insurance. This time it had had the advantage of dealing with a "spineless" Minister, weak-willed, and not possessed of the technical knowledge necessary for dealing with such a subject. The White Paper, said Dr. Summerskill, embodied to the extent of 75% the principles of Labour. Labour had been accused of wanting to take away the freedom of the medical profession. As herself a doctor, the wife of a doctor, the daughter of a doctor, and the sister of a doctor, she repudiated that. A salaried medical service would strike off the shackles, not bind them. As for the administrative proposals which Mr. Willink had offered the B.M.A., the medical profession would dominate at every level. At one level, she said, of 34 members only five would be representatives of the local authorities.

Rehabilitation

The B.M.A. has been extremely fortunate in securing 34 first-class men to serve on its Rehabilitation Committee, which has held its first meeting this week. The committee includes men who can speak with authority in orthopaedics, in various other specialties such as otology and ophthalmology, in industrial medicine, in hospital services, and in public health. One of the documents placed before the first meeting of the committee traced the work of the Association on rehabilitation, for the proposal of the Council last December to set up this committee was by no means the beginning of the chapter.

Ten years ago the Association's Committee on Fractures, which had been set up in 1933, reported, and an immediate result was the appointment by the Government of what is now known as the Delevingne Committee, an interdepartmental committee on the rehabilitation of persons injured by accidents. The Fractures Report had another outcome. A joint committee of the B.M.A. and the T.U.C. was set up, and the results of its discussions on rehabilitation were embodied in the evidence presented to the Royal Commission on Workmen's Compensation in 1940. The sittings of that commission were suspended during the early part of the war, and their resumption was made unnecessary by the Government's adoption of the principles of the Beveridge report.

A wider investigation into the whole problem of the medical aspects of rehabilitation seemed to the Council now to be necessary, and the new committee is the result.

Public Health Appointments

Some misgiving appears to have arisen among holders of public health medical appointments concerning the recent issue of Circular 62/45 by the Ministry of Health to local authorities. The circular states that the Minister has decided that further steps must be taken to secure that the limited resources now available for the medical staff of the public health services shall be used to the best possible advantage. All proposals for a new appointment—that is, an appointment additional to the existing establishment—are to be held for review at intervals, and such proposals, together with those for filling vacancies due to death or retirement, will not be approved until every effort has been made to arrange for the duties of the proposed or vacant post to be otherwise carried on. It is expected that the authority will consider the possibilities of postponing retirement, reorganizing duties, making arrangements with neighbouring authorities, and also of making increased use of the part-time services of private practitioners.

All this is really a following up of an earlier circular issued in May, 1943, but some who have written to the B.M.A. have supposed that it will prevent a medical officer from leaving an institution for a better post. What it seems to amount to is that each case must be put up to the principal regional medical officer for permission, and it is the experience at Tavistock Square that the Ministry does give careful consideration to such applications. So far as can be gathered, each case will continue to be given its due weight, having regard to the needs of the institution and the authorities.

FROM THE PRESS CUTTINGS

"It would be better to recognize frankly that in a society such as ours, where wide economic and other divisions still persist, a classless medical service cannot be swiftly introduced except by methods which would impose on doctors and patients alike a bureaucratic discipline liable to defeat its own ends. It may be wiser to proceed slowly, building on the existing system and improving it, with the willing co-operation of the great majority of doctors, by degrees; while at the same time pressing on with the campaign against those social evils of malnutrition, bad housing, and gross poverty which create more sickness than any medicines can cure."—*Observer.*

"Yet there is nothing outrageous in the fact that modifications of the original proposals have been discussed. . . . Great play has been made of the report that the general establishment of health centres would be postponed until experiments with different types of health centres in different areas had been carried out. But health centres are not a fundamental part of a National Health Service. The principle underlying such a service is that full medical, hospital, and rehabilitation services should be available to everyone irrespective of their means, and the criterion for judging the alternative proposals should be whether they would promote this objective more successfully than the administrative structure of the White Paper."—*Economist.*

THE MEDICAL AND SANITARY SITUATION IN INDIA

BY

M. N. PAI, M.R.C.P., D.C.H., D.P.H., D.T.M., D.P.M.

I crave the hospitality of these columns to draw once again the attention of the British medical profession to the medical and sanitary situation in India. As early as 1940 I pointed out (*B.M.J.*, Aug. 24, p. 168) how a nation-wide campaign on behalf of indigenous medicine (i.e., Ayurvedic medicine for Hindus and Unani or Arabic medicine for Moslems) was being organized, how public funds were being spent in opening schools of Indian medicine, and how everything was being done to discredit science and Western medicine. After five years one may be excused for taking stock of the situation, especially, in view of the large numbers of British and Allied Forces now stationed there.

Some Obvious Defects

For a population of 388 millions there are only 42,000 doctors, of whom only a few have the additional qualification of D.T.M. The number of medical colleges is hardly worth mentioning and the standard of teaching leaves much to be desired. Some of the professors have not even visited European or American hospitals, are not conversant with foreign languages (not even French or German), have no higher qualification than the medical degree of an Indian university, and do not even possess the D.T.M. This despite the fact that any number of my countrymen possessing the M.R.C.P. or the F.R.C.S. are available in India. The reason is simple. All appointments are made on a communal basis and on length of service in the Provincial cadre irrespective of additional medical qualifications, and merit is not infrequently sacrificed to feed the canker of communal representation.

The majority of the hospitals are ill equipped, and though in the Tropics microscopes are more essential than stethoscopes, it is doubtful whether in the whole country there are a thousand microscopes. In some schools as many as six students have to share one microscope. Medical books are scarce, those available often several years out of date, and there are no medical lending libraries.

As regards public health and preventive medicine there is nothing to be proud of, as epidemic and endemic diseases show no tendency to decline. In the Presidency town of Madras primitive methods of conservancy still exist. The number of doctors obtaining the D.P.H. and qualifying as health officers is totally inadequate because apparently there is no demand for their services. According to the report of the Central Advisory Board of Health for 1939 "nearly one-half of the districts and three-quarters of the municipalities in British India are still without qualified health officers."

Advances made in Britain and other countries in the knowledge of nutrition, endocrinology, chemotherapy, and immunology, as well as the application of these principles to the daily problems of life, have no serious meaning to Indians who obstinately insist that there is no higher knowledge than the wisdom of their forefathers.

Maternal mortality is still the highest in the world because, on account of the shortage of midwives, maternity services have not yet reached the masses, especially those in the villages. Recently the local authorities in Madras invited applications from fully trained and qualified persons in receipt of a midwives' certificate for appointment as midwives at a salary of Rs. 25 (£1 17s. 6d.) per month! Thousands of young would-be mothers are allowed to undergo the agony of painful childbirth and perhaps septic complications and chronic invalidism because the Government and Legislative Assemblies are not prepared to pay higher salaries to midwives and nurses. The spectacle of pregnant women unable to obtain medical or midwifery help slowly dying from difficult labour, haemorrhage, or exhaustion while the utterly helpless relatives stand around with folded arms praying for Divine intervention has to be seen to be believed.

Backward Propaganda

Meanwhile an incessant propaganda on behalf of Indian medicine is going on. Persons who in Britain would be scoffed at as charlatans have been glorified by the pompous title of "Practitioners of Indigenous Systems of Medicine," and admitted to a Medical Register. Some are in receipt of Government subsidies. In the Bombay Presidency, while there are only about 8,300 doctors, there are well over 12,000 names in the Register of Practitioners of Indigenous Systems of Medicine. There are also millions of unregistered practitioners in every walk of life. They are found among artisans and clerks, and even among persons holding high positions. The latter, of course, practise Indian medicine "as a hobby" and give medical advice gratuitously. In a leading daily newspaper of Madras one of the Indian doctors openly advertises his qualifications, quoting extracts from a testimonial given by a retired High Court judge (full name, titles, and address given in the advertisement), who, in the course of his certificate, says that his daughter's enlarged tonsils disappeared completely after a few applications of the advertiser's medicine.

About conditions in the Indian States the less said the better. In the "progressive" State of Travancore there are six State-aided schools of indigenous medicine. Not long ago (Nov. 25, 1944), during a discussion on the incidence of smallpox and vaccination in India at a meeting of the Section of Epidemiology of the Royal Society of Medicine, I pointed out how the absence of vaccination laws in certain Indian States was having an adverse effect on the health of the population of the neighbouring Provinces of British India. What applies to smallpox applies with equal force to other epidemic and endemic diseases.

The yearly toll from preventable diseases is grim evidence that the health of the dumb millions is being sacrificed to the selfish interests of quacks and magicians. It is true that in this atmosphere of ignorance, superstition, sickness, and sin a small band of missionary doctors—British, American, and Indian—are still carrying on with their labour of love, expecting neither reward nor recognition, and the large crowds which flock to the out-patient departments of hospitals and dispensaries should convince those competent to judge that the Indian masses demand medicine, not magic.

Some Proposals for Reform

Can anything be done to remedy this unsatisfactory state of affairs? If the British Governors who administer the Provinces (in the absence of Congress Ministers) have the courage of their convictions they can put down quackery with a firm hand, and abstaining from expressions of sympathy declare the practice of indigenous medicine a criminal offence. Secondly, the medical schools and colleges should be thoroughly overhauled with a view to raising the standard of teaching. Professors holding mediocre qualifications should be weeded out. It is false patriotism which asserts that Indian degrees are the highest qualifications in the world. Persons (preferably those with international reputation) irrespective of nationality, race, or religion, should be appointed (by invitation if necessary) to the teaching posts. Only those who have been trained in the great hospitals of the British Isles and possess higher diplomas granted here should be appointed to any of the chairs.

Though (except for the abnormal conditions created by the war) there is no statistical evidence that during the last several years there has been a falling off in the number of Indians coming to this country for postgraduate education, it is desirable to encourage more Indians to obtain higher medical qualifications in this country. A "change of heart" on the part of the Government and Legislative Assemblies in India is necessary, and those Indians in possession of additional British or European medical qualifications should be paid higher salaries than those possessing Indian degrees only.

Several other reforms are long overdue. The pay of medical licentiates and of those in the subordinate medical services (some of these get less pay than a private in the British Army) as well as the pay of nurses and midwives should be raised without delay. Promotion should be for merit only and not for cringing, fawning, or persistent begging.

Finally one cannot repeat too often that it is India's dependence on the bondage of magic, mediocrity, and mendicancy which has clogged the wheels of progress and made her a pariah among the nations.

BLUEPRINT FOR NATIONAL HEALTH

AN AUSTRALIAN PROGRAMME

Sir Raphael Cilento, who is Director-General of Health and Medical Services for Queensland, has written, in his personal capacity, what he calls a *Blueprint for the Health of a Nation* (Sydney: Scotow Press). His proposals, of course, are in the Australian setting, which is different in many respects from that of Great Britain, but he shows a close acquaintance with what is happening in this country and quotes extensively from our current literature. The fairness and lucidity with which he sets out all sides of the question, almost in the "handbook for debating societies" manner, makes this small volume a useful contribution to present controversies and very interesting to the reader in this country. On some points, such as his evident preference eventually for a whole-time salaried service under the State, he will not be in harmony with the majority opinion of the profession here, but again the difference between the conditions in the two countries must be remembered.

The first principle which the B.M.A. has adopted, that the best medical services, general and specialist, domiciliary and institutional, must be available for every individual, is peculiarly difficult to apply in Australia with its vast distances and its variable population densities. Half the people of Australia are established in the capital cities of the six States, and from these over-dominant centres the population thins away rapidly, with an occasional provincial city, through intermediate rural towns, most of them "one-doctor" places, to outpost sidings and small clusters of dwellings, which are unable to support a resident practitioner or even a nurse.

The Problem of Distribution

In aggregate Australia does not appear to be ill supplied with doctors. She has 6,000 practising medical graduates (including those for the time on active service), and it is expected that 1,700 more will graduate during the next five years. But the cities are over-supplied, while in the country there may be only one doctor to a population of 5,000. In Sir Raphael Cilento's opinion the necessary reorganization to make medical services available to every individual is not compatible with unrestricted competitive medical practice of the isolationist type hitherto familiar. Team work is essential. He suggests a consultative health centre or polyclinic in every town of 15,000 or more people and in every suburb of 15,000 to 50,000 people, with perhaps 15 or 20 practitioners attached. The health centre, however, can hardly be successful in the more scattered rural communities. In small towns, in his opinion, all the practising men in the district should be attached to the nearest hospital in capacities suitable to their individual ability and local needs. As for the outpost practitioners, they must be made part of the State organization and given access to adequate specialist aid.

For the control of such a service the author of this *Blueprint* favours a corporate body under the Government, but he is opposed to the demand which has arisen in Australia that the whole control of the scheme should be by a body predominantly medical from which even medical men with administrative training in the public service are excluded, so that the permanent majority on the controlling body would be private practitioners hitherto engaged in private competitive practice. He believes that this demand indicates a "blind spot"; it loses sight of the greater claims of the larger of the two contracting parties—namely, the potential patients, numbering 7,000,000, as against the doctors, numbering 7,000. But, worse than this, the positive action of any corporate body would be fatally hindered if some of its members were there for the express purpose of advancing the interests of the sections for which they were responsible.

In his view a central co-ordinating health corporation appointed by the Government for the provision and administration of a comprehensive medical service is necessary during a ten-year trial period. In this connexion another difference between Australia and Great Britain may be mentioned. In Great Britain we have local authorities which are autonomous, or nearly so, but in Australia the local authorities, which number nearly 1,000, have always, for reasons connected with history and geography, been excluded from major functions. In the new health service the administrative units will be the States, with, in each State, a health council supervising and directing the administration in the regional areas, and in the regions, other bodies representing the Government and the constituent local authorities, and with medical advisory and service units responsible for carrying out the health programme.

Paying the Practitioner

Sir Raphael Cilento believes that ultimately an almost entirely salaried service will emerge, though the process may be gradual, with trial and error, and a part-salaried service may obtain for some intermediate period. "Economic security is the compelling factor in all business transactions; it seems likely that it will be found, for most of the medical men, only in active association with the all-inclusive medical service provided by the Government." He criticizes the capitation method of payment, and suggests that in Great Britain it was this method embodied in National Health Insurance which proved so unpopular that it led to the present demand for change. That is a misreading of the position. There has always been complaint on the part of British practitioners that the capitation fee was too low, but no widespread objection has been taken to the method of payment, as was illustrated by the results of the recent Questionary. The National Health Insurance system has never appealed to the Australian public. Although a National Health and Pensions Insurance Act was rushed through the Commonwealth Parliament in 1938, it was based upon practice that was already obsolete, and it has never been proclaimed.

The author of this *Blueprint* brushes over, perhaps too lightly, the "bogy" of civil servant status, saying that it depends entirely on the medical men themselves to what extent it bulks in the final scheme. On the subject of "direction" of practitioners, he admits that Australian doctors are agitated by the possibility that under a State service, in view of the unequal distribution of practitioners in the Commonwealth, they might be sent at a moment's notice to Darwin in the Northern Territory or Marble Bar in Western Australia, breaking up their established home and other interests, but he adds that "nothing could be more ridiculous." The young graduate, after completing his hospital year, and electing to join the service, would spend a further year at a consultative health centre, with its "general practice atmosphere," and then might reasonably be required to go for two years to an outlying district. At the end of that period, in his fourth year after qualification, he should be free to make his decision as to specialty, general practice, or hospital work, and, having found his post, nothing could compel him to change it.

A very refreshing book, the work of a medical statesman, whether one agrees with its conclusions or not.

PUBLIC RELATIONS IN BRISTOL

Between September, 1944, and the end of March, 1945, the Public Relations Committee of the Bristol Division of the B.M.A. met five times, when plans were made for meetings to discuss the White Paper. The committee also, at the request of the Bristol Associated Discussions Clubs, dealt with criticisms of the plan for a national comprehensive State service drawn up by the latter body in co-operation with the Bristol Medical Study Group, and prepared a questionary on medical services for the Bristol Committee of Townswomen's Guilds. At the last meeting it was decided to report the following matters to the executive.

Report to Executive

Having decided last September that the most useful work it could do would be to get in touch with people in all walks of life, the time not being considered opportune for further articles in the press, the Bristol Public Relations Committee arranged some twenty-nine meetings in all parts of Bristol, including four Unionist district meetings, women's meetings of all kinds, gatherings of medical auxiliaries, nurses, religious bodies, youth organizations, of the Bristol Rotary Club, and of Civil Defence and factory workers. From these meetings and the sixteen held before September, 1944, the committee feels it has gained useful knowledge of the attitude of the public to the B.M.A., the White Paper, and doctors as a whole. It has been found that the public generally had many erroneous impressions about the B.M.A. They regarded the Association as antagonistic to reform and "anti-Beveridge." After discussing the White Paper and explaining the profession's criticism of the proposed administration, the majority in the audiences have been very largely in sympathy and agreement with the doctors, even going so far at one meeting as to wish to pass a vote of confidence in the B.M.A. The public want free choice of doctor and freedom to change their doctor. They do not want their family doctor to be a civil servant, nor to see professional secrecy endangered by the inclusion in the medical services of non-medical staff. Women want to attend their own doctor's surgery, and are very much opposed to health centres—an attitude which came as a surprise to all the committee; at one meeting—at the University Settlement—94% voted against health centres. Finally, the public do not want the State to have a monopoly in medicine; experience through the war seems to have taught them the value of individual enterprise.

The meetings have all been thrown open to discussion and questions. The committee has been able to correct many misunderstandings about the doctor's life and work. In its view, the public's interest in health services is steadily growing, and more intelligent questions are asked now than at earlier meetings. Most groups are to have further discussions and study among themselves and have asked the committee to visit them again later. The National Association of Townswomen's Guilds, which received the questionary drawn up at the request of its local division, has decided to arrange a campaign over the country to obtain the views and wishes of women generally. One particularly interesting meeting was a medical "Brains Trust" at Wills's factory. The committee thinks that a very useful part of its work has been the contacts made with the Associated Discussions Clubs of Bristol. It acknowledges with thanks and appreciation the help received throughout in arranging and addressing meetings, particularly from Drs. P. Phillips, H. M. Golding, Doris Heron, C. C. Morgan, and W. H. Hayes.

Correspondence

Safeguarding Private Practice

SIR,—It is obvious that we are fighting, and shall have to fight considerably more strenuously, for our professional independence. What our negotiators are doing, if anything, to safeguard the only alternative to State medicine—namely, private practice—is, unfortunately, far from obvious. The White Paper states that the Government has no desire to interfere with private practice. Whitehall is far too astute to incur the odium of a direct assault on private practice when it knows that the White Paper scheme will, in operation, automatically kill it stone dead. Here are some relevant facts.

The scheme is to cost £700 million a year; 75% of this sum, say, £500 million, is to come from the taxpayer. When inflated wartime wages in due course come to an end the number of direct taxpayers will drop, probably to about five millions, each of whom will have to shoulder a burden averaging £100 a year for this scheme alone, in addition to vast subsidies for housing, food, education, children's allowances, and so forth, not to mention the interest on the astronomical National Debt. The standard of living of the direct taxpayer—or rather "tax slave"—will be seriously reduced. He will have to look at every shilling before he spends it, and he will very quickly come to the conclusion that he cannot afford to pay fees to his old friend, the family doctor, when he is paying out on an average £100 a year, which entitles him to queue up for "free" doctoring. He will not have the money to pay for doctoring twice over. The private doctor will therefore, in accordance with the Machiavellian forecast of Whitehall, sooner or later be forced to come to heel.

I can see only one possible safeguard for private practice and our independence. The scheme must be voluntary, and that means, if "Mr. Smith" the taxpayer does not want to join he shall be absolved from paying not only weekly contributions but also all *ad hoc* taxation. In fact let him keep his £100 in his own pocket to pay his own doctor's bills. Is this going to be a free country or is the standard of living of tens of thousands of English homes to be drastically cut down to pander to the power lust of a handful of Whitehall bureaucrats?—I am, etc.,

C. J. NEPEAN LONGRIDGE.

London, W.2.

Social Insurance and Certification

SIR,—The question "Shall we nationalize medicine?" is bound up with another: "Shall we have a national social insurance plan—a Beveridge plan?" It must, I think, be agreed that impartial medical certification is essential to the success of the Beveridge plan; also that impartial certification, whether by doctor or layman, can be assured only if the income of the certifier is assured no matter what his decisions—i.e., if he is in receipt of a fixed salary. Opposition to a salaried medical service is tantamount, therefore, to opposition to the Beveridge plan. Are we justified in "torpedoing" this great plan by insistence on the type of medical service *we* prefer? I do not think so.

I would prefer a National Medical Service to a revival of regional medical officers—the medical "gestapo." With competition among doctors virtually unrestricted it is necessary, in my opinion, to certify indulgently in order to retain one's practice. I have lost many patients through correct certification. Indulgent certification tends, however, to bring one into conflict with the regional medical officer. We are between the devil and the deep sea, and a National Medical Service is the only solution. I am of the opinion, moreover, that the nation's health would greatly benefit.—I am, etc.,

Wallasey. LENNOX JOHNSTON.

"Doctor"

R. S. S. writes: I note a paragraph in "Heard at Headquarters" in which it is stated that "evidently a good many medical men have decided to keep the 'doctor' labels on their windscreens until the end of the Japanese war." I wonder if it is realized what a boon these labels have been to medical men on their rounds. It was only when I had to discard the sign (faded and torn) that I myself realized this. Since taking it off, troops in convoy, on the march, and on exercises have caused me much delay. For my part I do not wish to discard the label until troops have left our district, for there is no doubt that when they see it they realize the urgency and readily give the right of way without any query or delay. Much credit must be given to men serving in the Forces, who, in my experience, have done all possible to cause the minimum of delay to medical men on their rounds.

BRITISH MEDICAL ASSOCIATION

Election of 22 Members of Council by Grouped Branches in the British Isles; of 2 Public Health Service Members; and of 1 Woman Member

As a result of the nominations received for the election of twenty-two members of Council, the following have been elected for the session 1945–6: Weldon Watts (Newcastle-upon-Tyne); L. Dougal Callander (Doncaster); E. C. Dawson (Derby); C. M. Stevenson (Cambridge); J. A. Brown (Birmingham), J. A. Ireland (Shrewsbury); F. Gray (London); E. A. Gregg (London); A. M. A. Moore (London); H. H. D. Sutherland (London); F. H. Bodman (Bristol); J. A. Pridham (Weymouth); J. G. Thwaites (Brighton); John H. Otty (Aberdeen); P. Martin Brodie (Edinburgh); I. D. Grant (Glasgow); G. MacFeat (Lanark); G. J. A. Woodside (Belfast).

The following candidates have been nominated: For Group C (Isle of Man, Lancashire and Cheshire), R. Kennon, R. L. Newell, D. R. Owen, F. M. Rose, S. Laurie Smith. For Group L (Southern, Surrey), C. N. Binney, N. E. Waterfield. Voting papers will be issued to the members of these Groups on June 9, 1945.

No nomination has been received for Group H (South Wales and Monmouthshire).

Public Health Service

The following, being the only candidates nominated for election as members of Council for 1945–6 by Public Health Service members, are hereby declared elected for 1945–6: James Fenton (Kensington), R. M. F. Picken (Cardiff).

Woman Member

Janet Aitken (London), being the only candidate nominated for election by women members, is hereby declared elected as a Member of Council for 1945–6.

CHARLES HILL,
Secretary.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1) Week end course in general surgery, at North Middlese Hospital, all-day, Sat and Sun., June 16 and 17 (2) Week-end course in ear, nose, and throa diseases, at Metropolitan Ear, Nose, and Throa Hospital, all-day, Sat. and Sun., June 30 an July 1.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*West End Hospital for Nervous Diseases:* Mon. Tues., and Fri., 2.30 p.m., M.R.C.P. course i neurology. *Royal Westminster Ophthalmi Hospital:* All-day, Sat. and Sun., June 9 and 1C Week-end course in ophthalmology.

EDINBURGH POSTGRADUATE LECTURES.—At Edin burgh Royal Infirmary, *Thurs.,* 4.30 p.m., Di A. S. Johnstone: Dysphagia due to Causes othe than Malignant Disease.

DIARY OF SOCIETIES AND LECTURE

ROYAL SOCIETY OF MEDICINE.—*Tues.,* 5 p.m General meeting of Fellows; 5 p.m., Section Psychiatry. *Wed.,* 2.30 p.m., Section of Histoi of Medicine. *Fri.,* 5 p.m., Section of Ophtha mology.

BIOCHEMICAL SOCIETY.—At Glasgow Universit *Sat.* (June 9), 11.30 a.m. Communications an demonstration.

ROYAL INSTITUTION, 21, Albemarle Street, W.—*Fri.,* 5 p.m., The Lord Moran of Manton: Courag and Fear.

BIRTHS, MARRIAGES, & DEATH

The charge for an insertion under this head 10s. 6d. for 18 words or less. Extra words 3s. 6 for each six or less. Payment should be forward with the notice, authenticated by the name a permanent address of the sender, and should rea the Advertisement Manager not later than first p Monday morning.

BIRTHS

CARSON.—On May 18, 1945, to Doreen, wife Major D. M. Carson, R.A.M.C., of Nottinghar twin boys.

DUNCAN.—On April 27, 1945, at Queen Elizabe Hospital, Birmingham, to Joan (*née* Hyde), wi of Dr. Neil A. Duncan (C.M.S., St. Helen a son.

FRANCIS.—On May 24, 1945, at University Coll Hospital, to Pamela (*née* Spratt), wife of Su Lieut. R. S. Francis, R.N.V.R., a son—Gare Hugh.

MANSBRIDGE.—On May 19, 1945, at Holmwo Nursing Home, West Bridgford, Nottingham, Florence (*née* Craven), wife of Fl. Lieut. T. Mansbridge, M.B., Ch.B.Glas., a daughter (Fa sister for Drummond.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY JUNE 9 1945

THE PURCHASE OF A PRACTICE

GENERAL CONSIDERATIONS

After the war the young doctor who wishes to buy a general practice may be confronted with great difficulties. Rates of taxation are likely to be high, the average age of many entrants to general practice will be above the normal, and a substantial proportion will be married. The repayment of a loan will present to many a serious problem. Notwithstanding these difficulties the B.M.A. believes that the facilities which have been secured after negotiation with the bodies concerned represent substantial improvement over existing schemes, and that a doctor without capital will be able to buy a practice and at the same time retain after discharging his commitments a net income sufficient to maintain a reasonable standard of living.

In the following factual statement it is assumed that the purchaser is unable to pay any part of the purchase price from his own resources and that the goodwill is valued at two years' purchase. Only the purchase of goodwill has been considered. The doctor's house and furniture, his car, his equipment, and stock of drugs, which are relevant and important factors, have been left out of account.

The Association recognizes that to embark upon a loan for the purchase of a practice may be a serious undertaking. This is true of any loan which has to be repaid out of income; but if the young doctor acts wisely in the choice of the practice he wishes to buy or of the partnership he proposes to enter, and if he can obtain competent advice from those who are accustomed to deal with the sale and purchase of practices, he may hope to acquire a valuable and realizable asset. In short, he will be making an investment the capital value of which may be increased by his own efforts.

Further, there are certain practitioners who, anxious to retire or to obtain help, are willing to act generously to young doctors by making available to them partnerships and practices, providing for the repayment on advantageous terms. At the appropriate time the Association will be glad to take such steps as are necessary to bring such practitioners into contact.

It may be asked: What will be the position of a doctor who has borrowed money to buy a practice under the proposed National Health Service? The Government has announced that it does not propose to make any alteration in the present custom of buying and selling practices in the Health Services Bill. A full inquiry into the whole question will be instituted after the new service has come into operation and experience of its working has been gained. If, as a result of the inquiry, the sale of practices is abolished or restricted by law the doctors affected will receive all proper compensation. This is the Government's decision communicated formally to the Association.

I. METHOD OF PURCHASE BY LOAN, REPAYABLE BY INSTALMENTS

Before the war the majority of loans for the purchase of practices were negotiated either through insurance companies or British Medical Finance Ltd. The volume of this class of business undertaken by insurance companies was considerable. When war broke out most insurance companies ceased to offer these facilities, and it may be assumed that, with few exceptions, they will not take an active part in this business as lenders for some time to come. The Medical Sickness, Annuity and Life Assurance Society, Ltd., has intimated that it is prepared to consider applications for loans for the purchase of practices.

British Medical Finance Ltd., Tavistock House, W.C.1, was established in 1936 as a result of action taken by the B.M.A. This company is prepared to grant loans for the purchase of practices, and also to make advances for the purchase of cars and equipment.

The Association has recently had conversations with the Medical Insurance Agency and the Westminster Bank with a view to introducing a new scheme in which these two bodies will collaborate, and which will offer to the borrower most advantageous terms. As a result loans may be arranged at a rate of interest of 1/2% above bank rate with a minimum of 4%. If the bank rate rises above 3½% the rate of interest payable on the loan will, of course, rise above 4%, and the terms of the loan must be altered to meet this situation.

In this scheme advances may be made in approved cases up to the full amount of the purchase price, the only security being a mortgage on the practice, together with a life insurance policy for the amount of the loan. Sickness or guarantee policy is not a condition of the loan. Repayment will usually be made by quarterly instalments including both principal and interest. These may be equal throughout the period of repayment, the proportion of principal increasing as the interest on the amount outstanding decreases; alternatively, the instalments of principal may remain constant, the amount of interest and therefore the amount of the instalment decreasing as the loan is paid off. Provided the instalments are paid regularly the loan cannot be "called in" before expiry of the full term.

The following example shows the annual cost of repayment by equal quarterly instalments over periods of 10 years and 15 years respectively of a loan on a practice estimated to bring in a gross income of £1,500 and bought at 2 years' purchase. Practice expenses in both cases have been estimated at 30%.

Expenses of Repayment over Period of

	10 years		15 years	
Rate of interest 4%	£	£	£	£
Gross income from practice		1,500		1,500
Net taxable income (after deduction for practice expenses)		1,050		1,050
Loan costs (per annum) ..	365		267	
Whole life insurance (without profit) on a first-class life aged 30 at entry ..	52	417	52	319
		633		731

In neither case has allowance been made in respect of income tax relief on the interest of the loan nor on the premium for the insurance policy (£9 approx.). At present (1945) as the amount of loan interest decreases relief will decrease from £65 to £5.

The low rate of interest makes a considerable reduction in the total cost, but the bulk of each quarterly instalment consists of capital repayment. In cases of difficulty the instalments may be reduced either (1) by extending the period of the loan; or (2) by leaving on long-term loan a proportion, say, one-third of the total sum borrowed.

As regards (1), it is to the advantage of the borrower to make the term of the loan as short as possible. A ten-year period has hitherto been considered the more suitable, but if the period of repayment is extended to 15 years this will have the effect of reducing the amount of the instalments by approximately one-quarter. In any case it is at all times open to the borrower to repay the whole or part of the outstanding loan at an earlier date.

As regards (2) a practitioner may wish to buy a practice bringing in a gross income of £1,500 at 2 years' purchase, thus incurring an expenditure of £3,000, but he may find it necessary to defer repayment of a proportion of the capital, thus reducing the amount of the annual charge on his practice. Under the scheme of the M.I.A. it has been agreed that in *exceptional cases* arrangements may be made to leave a proportion of the loan on long term by calculating the amount of instalments on the basis that two-thirds of the loan would be repaid within ten years. At the end of that period the remaining one-third would be dealt with on the usual principles applicable to a banking advance. This balance would not be regarded as a fixed loan but as one in which reasonable reductions will be made from time to time. Interest on the deferred amount would be paid throughout. The whole sum borrowed would be covered by an insurance policy or policies, and it would be open to the borrower to repay the capital outstanding at any time.

House Purchase

It has also been arranged that when the purchase of a practice also involves the purchase of a house advances may be made to cover the whole amount. Though this may mean two transactions the loan will be regarded as a single entity, subject to repayment by agreed instalments.

Assurance Policies as Security for Loans

In all forms of loan on the security of a practice some form of assurance cover on the life of the borrower is required as collateral security. An existing policy may be acceptable as security for the whole or part of the loan. Cover may be of three kinds: (*a*) whole-life insurance; (*b*) endowment insurance; (*c*) decreasing-term insurance.

(*a*) A *whole-life policy* for a first-class life aged 30 next birthday would cost about £52 a year; at the end of ten years the surrender value would be about £250. A whole-life policy can be converted at any time into an endowment policy by arrangement, with adjustment of premium.

(*b*) In the case of an *endowment insurance* for £3,000 taken out at the age of 30 and maturing at 65 the annual premium would be approximately with profits £87; without profits £71. In both cases if the premiums are paid quarterly there is a small extra charge. Rebate of income tax at the current rate (at present 3s. 6d.) can be claimed in respect of premium for life insurance.

(*c*) *Decreasing-term Insurance.* This form of insurance, although considerably cheaper than whole-life or endowment insurance, provides cover only for the outstanding amount of the loan at any given time; cover ceases at the end of the term to which it applies. The disadvantage of this type of cover is that the assurance comes to an end at the expiration of the term and provides cover only in case of death within that term, whereas a whole-life or endowment policy not only remains security while premiums are continued but is a means of saving and acquires in course of time a substantial surrender value. The total cost of a decreasing-term insurance to cover the outstanding amount of a loan of £3,000 repayable in 10 annual instalments of £300 (age of proposer 30) would be about £125.

II. THE ENDOWMENT INSURANCE METHOD

Loans for the whole of the purchase price (or for the amount that the practitioner cannot provide from his own resources) are necessary in all cases where the vendor requires immediate payment of the capital sum. In a death vacancy it may not be in the interests of the purchaser that the executors of the previous owner should continue to have a controlling interest in the practice.

There is, however, a group of cases—for example, partnerships—where the vendor may be prepared to accept deferred payment. In these cases the method described below gives the borrower advantages which cannot be obtained by the method of direct loan. One advantage is the greater relief from tax in proportion to the annual cost of the loan obtainable; another that no part of the practice need be mortgaged to a third party as security; this remains with the vendor. An arrangement of this kind may well be the method of choice in appropriate cases after the war. The suggested scheme is briefly as follows:

1. The purchaser takes out an endowment life policy on his own life for the full amount of the purchase price. This policy is assigned as security to the vendor and the assignment intimated. The purchaser remains liable for premiums, thereby obtaining income-tax rebate.

2. The proceeds of the policy on maturity will accrue to the vendor less any amount which may have already been repaid on account of capital.

3. The vendor receives interest on the purchase price at an agreed rate, say 4% less income tax at prevailing rates.

4. The payment of the insurance premium and the interest is a first charge on the practice or partnership share and can be assigned to the insurance company and the vendor respectively from the quarterly panel cheque or by a banker's order.

5. In the event of default of payments the practice would revert to the vendor, who would be entitled to keep the policy in force or take the surrender value. For example:

Purchase of a share estimated to produce a gross income of £1,500 at 2 years' purchase, expenses being estimated at 30%:

	£	£
Gross income		1,500
Practice expenses		450
Income subject to tax		1,050
Annual premium on endowment policy for £3,000 (without profits) payable in 10 years (first-class life aged 30 on entry)	288	
Interest on £3,000 at 4% (payable to vendor)	120	
	408	
		408
		642
Rebate of income tax at present rates on premium (£37) and interest (£60) ..		97
		£739

Provision must, of course, be made to meet a situation where the vendor dies before the expiration of the period contemplated in the arrangement, and where the executors would require early payment of the loan. It has been ascertained that in these circumstances there would be no difficulty in arranging a loan under one or other of the schemes already mentioned. It must be noted, however, that the endowment policy referred to in this section is in effect comparable with the decreasing-term arrangement mentioned above, in that the purchaser has no assurance remaining when his debt is paid off.

SUMMARY

The borrower has a choice of two methods.

He may approach the Medical Insurance Agency, B.M.A. House, Tavistock Square, W.C.1, who will collaborate with the Westminster Bank in investigating the security—i.e., the practice. If advantage is taken of the M.I.A. scheme it will be necessary for the borrower to open and maintain a current account with any branch of the Westminster Bank for the purpose of the loan, but this need not affect his private banking arrangements.

Alternatively, where the vendor is prepared to accept deferred payment receiving meanwhile interest on the amount owing, the purchaser should consider whether a short-term endowment assurance assigned to the vendor will meet the needs of the case. There is probably little difference in the cost of policies offered by the leading insurance companies, but again advice should be sought from the Medical Insurance Agency. The Medical Insurance Agency was founded for the essential purpose of providing for the medical profession a source of skilled advice on all insurance matters. It gives to its members a direct rebate on premiums and makes no profits, any surplus being allocated to medical charities.

GENERAL MEDICAL COUNCIL

SUMMER SESSION

The 164th session of the General Medical Council was opened at 44, Hallam Street, W., on May 29, with the President, Sir HERBERT LIGHTFOOT EASON, in the chair. The number of penal cases on the programme of business—twenty-five—constituted a record in the history of the Council, but the President intimated that the Council would not sit beyond Saturday morning, and that any cases left over might be dealt with at a later special session.

Prof. James Malachy O'Connor as the representative of the National University of Ireland, Dr. Andrew Davidson as Crown nominee for Scotland, and Dr. N. E. Waterfield, who under the Temporary Provisions Order had been appointed by the Council to fill the vacancy among the direct representatives for England occasioned by the retirement of Mr. Bishop Harman, were introduced and took their seats.

PRESIDENT'S ADDRESS

The PRESIDENT opened his address by saying:

"It is now six years since the Council met in times of peace. During that period the Council's house has received severe damage owing to enemy action. It is to be hoped that the authorities may as soon as possible permit such necessary repairs as may enable the Council to conduct their business with less expenditure of time and energy than has resulted from the restrictions on their accommodation here. I should like to take this early opportunity of thanking my colleagues on the Council for the unfailing regularity with which they have attended the meetings of the Council, even though they have incurred much discomfort and some danger in so doing. I am sure that the Council would desire also to express their appreciation of the services of their depleted staff during this difficult time. Neither air raids nor transport difficulties have been permitted by the registrar and his colleagues to prevent each and all of them from attending with the utmost regularity to carry out their duties, duties which have been far more onerous than in times of peace."

The President then referred with deep regret to the deaths of Dr. Denis Coffey, the "father of the Council," Prof. A. W. Sheen, who had been a member since 1927, and Prof. Harold Collinson, a former member of Council, and afterwards inspector of qualifying examinations in surgery; also to the retirement of Prof. D. F. Cappell, Mr. John Ritchie, and Mr. Bishop Harman. Of the last-named he said: "Mr. Bishop Harman's long service on the Council in these various capacities was of great value, not only from his intimate connexion with the British Medical Association and his knowledge of the views of the profession as a whole, but from the extremely logical and clear-sighted way in which he faced every problem that came before the council."

He then welcomed new members: Prof. Henry Cohen and Prof. W. J. Tulloch, who had taken their seats at the special session in February, and Prof. O'Connor, Dr. Andrew Davidson, and Dr. Waterfield, whose terms of office began with the present session.

Revision of the Curriculum

The President continued:

"Progress has been made with the revision of the curriculum which so far as the Council are concerned means the revision of their recommendations to licensing bodies, first, as to the education in general and in preliminary scientific subjects of persons desirous of entering the profession; secondly, as to professional education; and, thirdly, as to professional examination. The four special committees appointed by the Council to report to the Standing Committees on Education and Examinations on the revision have all met, and have probably carried their work as far as is practicable until observations by or on behalf of all the bodies are before them. A majority of the bodies, by hard work under war conditions, have already been so good as to furnish the Council at least with preliminary observations. Some of the others cannot be expected to depart from the procedure which their own organization normally requires them to follow in settling their views on a matter which should not be too hastily dealt with. I think it is already clear that, except perhaps in the field of social medicine and public health, the Council's task in the revision of the recommendations may be less heavy than we might have expected or feared. The object of the recommendations is, after all, no more than to indicate to licensing bodies the minimum curriculum which the Council, testing its results by visitation and inspection of examinations, are likely to be able to regard as sufficient to guarantee a proper standard of qualification. The larger, and the harder, task—to secure that doctors are not only qualified but are educated both in the general and in the professional sense—must always fall to the authorities of the bodies and of the medical schools, to the teachers, and to the examiners.

I ought to add that the Council may hope soon to have before them the general reports of the inspectors of qualifying examinations in medicine and in midwifery, whose arduous labours, begun in 1942, are now almost completed. We may be sure that we shall derive from these reports most valuable guidance in making any amendments to our recommendations as to professional examinations which seem called for by the public interest and by the progressive development of methods of medical education.

The number of practitioners on the *Medical Register* at the end of 1944 was 73,646, an increase of 1,764 over the number at the end of 1943. The total number includes 6,124 practitioners registered in the normal course, and 767 registered temporarily under Defence Regulation 32B, by virtue of qualifications granted in the British Empire outside the United Kingdom and Eire; and 603 practitioners registered in the normal course, and 3,169 registered temporarily, as foreign practitioners.

The great majority of the practitioners temporarily registered in what is still called, in the language of 1886, the list of Colonial practitioners, are serving in the armed Forces of the Crown, and only needed temporary registration because there happens to be no reciprocity between the Imperial territories where they qualified and the United Kingdom.

Of the foreign practitioners whose registration is temporary, many, and among them the first to be so registered, qualified in the United States of America, and they are for the most part engaged in military service. But the majority are graduates of universities in European countries which have never seen fit to enter into reciprocal relations with the United Kingdom.

We recognize, I am sure, the value of the services which these practitioners have rendered to the civil population here since the expansion of the armed Forces absorbed an increasing proportion of the practitioners of the United Kingdom. No doubt, however, as soon as some measure of order has been established in Central Europe it will be agreed that their own territories have the first claim upon them for assistance in the urgent task of restoring an efficient public and personal medical service for the benefit of their fellow-countrymen."

Vote of Thanks to President

Sir KAYE LE FLEMING, in moving a vote of thanks to the President, said that Sir Herbert Eason had been President since the beginning of the war. During his period of office he had had exceptional difficulties to face and had faced them in a spirit they all admired. He had earned not merely the respect and regard of the members but their affection. Dr. J. W. BONE expressed a similar feeling in seconding the motion, which was carried with acclamation.

Prof. Sydney Smith was re-elected Chairman of Business.

After a session *in camera* the President announced that John Holden Beckett and Ivor Llewellyn Edmunds had been restored to the *Dentists Register*.

COMMITTEE REPORTS

A report was made by the Education and Examination Committees on the progress of the qualifying examinations. The inspection of qualifying examinations in medicine has been completed. In surgery and in midwifery the only examinations remaining to be inspected are those of the Apothecaries' Hall of Ireland and the University of Dublin, and these it is hoped to complete during the present month.

The Pharmacopoeia Committee embodied a report of the British Pharmacopoeia Commission, which stated that the principal activities of the Commission during the past six months have been directed to the production of a new *Pharmacopoeia* as soon as possible after the end of the European war. Lists of suggested deletions from and additions to the present *Pharmacopoeia* and the *Addenda* had been issued for comment to the Governments of the Dominions, the medical services of the Colonies, Government Departments, and pharmaceutical and technical authorities. A new form of presenting the matter of the monographs with a view to greater precision and clarity has been approved. Collaboration with the Dominions and U.S.A. Committee of Revision continues actively.

DISCIPLINARY INQUIRIES

Convictions for Procuring Miscarriage

The Council considered the case of Delbert Evans, registered as of Park Lane, W.1, who had been summoned after a conviction at the Central Criminal Court of conspiring with other persons unlawfully to use an instrument with intent to procure miscarriage, and of unlawfully using an instrument or some other unknown means with intent to procure the miscarriage of eight women. He had been ordered to be imprisoned for two years in respect of the first offence and to be kept in penal servitude for five years in respect of the other offences (concurrent sentences).

The Council's solicitor, Mr. F. P. Winterbotham, said that in the case of six of the women mentioned Dr. Evans was charged jointly with another man whose name had been struck off the *Register* in 1942. The women went to the consulting-room in Cavendish Square and paid fees ranging from £25 to £150. These fees were shared between the two men. In the cases he dealt with by himself higher fees were charged, ranging from 100 to 350 guineas, plus nursing-home fees. All the fees were paid in cash, and the only entry in the books was three guineas for a consultation.

The Council found that Dr. Delbert Evans, who did not appear, had been proved to have been convicted, and directed the Registrar to erase his name.

The Council next considered the case of Francis Vincent Hanratty, registered as of Little Sutton, Birkenhead, who was summoned on the charge that he had been convicted at Chester Assizes on three counts, each concerning the use of an instrument on a woman with intent to procure a miscarriage. Dr. Hanratty had been sentenced to 21 months' imprisonment on each count, the sentences to run concurrently. A letter addressed from prison was read to the Council in which he stated that two of the women concerned showed every sign of impending miscarriage, and the third he did not remember. The evidence showed that in the first case he gave liquid extract of ergot, and this failing he inserted an instrument. The woman was later admitted to hospital in a hopeless condition and died. The other two women did not die. A fee of £5 was paid in each case.

The Council found the conviction proved, and directed the erasure of Dr. Hanratty's name.

Improper Behaviour to Patient

The Council considered the case of Richard Thorz, registered as of Cartwright Gardens, London, W.C.1, M.D.Prague, 1929, who was summoned on the charge that being in professional relationship with a married woman and her husband and children he behaved improperly to her and later committed adultery with her. The complainant in the case was the husband, described as Mr. A. B., who was represented by Mr. Harcourt-Williams. The respondent was represented by Mr. A. A. Pereira on behalf of the London and Counties Medical Protection Society.

Mr. Harcourt-Williams said that Mrs. A. B. and her husband were caretakers at a doctor's house where Dr. Thorz was locumtenent. Soon after coming to the house he became rather familiar with her, and on one occasion unsuccessfully endeavoured to have intercourse with her. He pestered her with his requests, and eventually she gave in and intercourse took place, as a result of which she became pregnant, but subsequently had a miscarriage in hospital. The evidence on behalf of the complainant was that on learning from his wife what had happened he had a stormy interview with Dr. Thorz, struck him, and secured an admission from him that adultery had occurred. The husband had been an insurance patient of the practice, and it was also alleged that Dr. Thorz had on occasion treated the woman and the children for minor ailments.

Dr. Thorz's defence was a total denial of the accusation. The whole incident, he said, was imagination on the woman's part. She had come to him, shortly after the date of the alleged adultery, and mentioned that she had a vaginal discharge. He had given her a prescription and some iron tablets, and told her that if in a day or two she was not better she would have to be examined. A few days later she reported herself better. He gave an entirely different account of the interview with the husband. The husband had accused him of committing adultery with his wife, and had said that he would report him to the General Medical Council: so far from admitting it he had simply said, "You can do what you like." He could suggest no reason why the husband and wife should have made such a serious accusation against him. There had been no quarrel.

The Council found the facts relating to improper behaviour and to an act of adultery proved to its satisfaction, and ordered the erasure of Dr. Thorz's name from the *Register*.

(*To be continued*)

HEARD AT HEADQUARTERS

The Negotiations

The General Election puts a full stop, or, at least a semi-colon, to many things, among them the negotiations with the Ministry of Health concerning the proposed new National Health Service. The Negotiating Committee held a meeting recently to receive the observations made by its constituent bodies on its report. These included the mass of resolutions forthcoming from the Special Representative Meeting. The three Royal Colleges in London, the Royal Faculty of Physicians and Surgeons of Glasgow, the Society of Apothecaries, the Society of Medical Officers of Health, and the Medical Women's Federation have also furnished the committee with observations, so that it will not want for a multitude of counsellors. On the following day the committee held a further discussion with the Minister, and then it was agreed to suspend the negotiations until after the General Election.

Rehabilitation Committee Gets to Work

The new Rehabilitation Committee of the B.M.A. at its first meeting invited Dr. Donald Hunter to be its chairman. Dr. Hunter was not present, and it is not known whether he will accept the invitation. If he does so the committee will be assured of very able leadership. Dr. Vaughan Jones of Leeds was elected to the deputy chair.

It is not intended that this committee, like some other special committees, shall devote itself to issuing a report. Perhaps there have been too many reports on this as well as on other subjects. Its job will be rather to watch rehabilitation from the point of view of the medical profession and to report to the Council when necessary. Several of the members were invited to submit memoranda to form the basis of discussions. The subjects included the consideration of facilities for rehabilitation, of medicine, surgery, psychology, and industrial medicine, each in relation to rehabilitation, and—an outstanding question—"What *is* rehabilitation?"

Progress in Australia

The health of the central Association is reflected even in its most distant Branches. The annual report of the council of New South Wales Branch is before me for the year ending last March. It shows a membership of 2,286—a gain of nearly 200 on the year. Twenty Branch meetings of one sort or another have been held, with an average attendance of 83, a very creditable figure, especially in view of the fact that many of the meetings were of a sectional nature. Then the Branch has nearly 40 representatives on outside organizations of one sort or another. Most of the members of the council made the full ten attendances during the year—again a good record, especially when it is remembered that New South Wales is not just Sydney and its environs, but that it covers an area six times the extent of England. The affiliated local associations of members bear such names as Blue Mountains, Broken Hill, and Far South Coast and Tablelands. The Branch has also fifteen special groups for the study of particular branches of medicine, the latest to be instituted being one for sociological medicine.

Erasure for Negligence?

On the programme of the General Medical Council at this session are two cases of a very unusual character in that the practitioners are accused of negligence in the treatment of patients. The Ministry of Health is the complainant, the patients concerned are insured persons, and the charge has evidently been brought after investigation by the local insurance committee. In the case of one of the practitioners the phrase is used in each instance "that you failed to visit or treat" and in the other "that you failed to exercise reasonable skill and care."

In my recollection of the G.M.C., which extends back for nearly thirty years, charges framed in this way have never been brought before it. There is, of course, a sense in which very many of the cases that come before the G.M.C. turn upon the question of negligence, though that word may not be mentioned. If a practitioner has been convicted of drunkenness the consideration which brings him before the Council is the neglect or possible neglect of his patients. Many certification cases may have the same background. But against negligence in the ordinary way the patient has his remedy in the courts, and, though many may think it extraordinary that it should be so, in the practice of the Council, as distinct from the possible use of its powers, a practitioner has not hitherto been liable to be struck off the *Medical Register* on account of negligence. Any negligence which justifies this action must, of course, be of such a degree as to merit the use of the words at the end of the charges, "and that in relation to the facts so alleged you have been guilty of infamous conduct in a professional respect."

Allied to the question of negligence is the question of incompetence, which is still more difficult. What standard is the Council or any other body to adopt in judging whether or not a practitioner is "incompetent"? Hitherto it has been assumed, for the purposes of ordinary administration, that admission to the *Register* is sufficient to indicate competence. It will be interesting to see by its action in these two cases what line the G.M.C. proposes to take and how it will assess lack of care and lack of skill. [Owing to the crowded state of the programme these two cases were not reached.]

Spain Waking Up

Industrial medicine seems to be going round the world. In Spain there has just been set up by the Government a National Institute of Industrial Medicine, Hygiene, and Safety. It forms a part of the Ministry of Labour and has eight sections, dealing respectively with general industrial hygiene and physiology, occupational diseases, psychophysiological classification, prevention of industrial accidents, industrial surgery and orthopaedics, a chemical-bacteriological laboratory, a statistics bureau, and a library. It has two secretaries, one for industrial medicine and one for industrial safety. Among the bodies which have the right to one representative on the board is the National Syndicalist Youth Shock Brigade!

LICENCES TO BUY NEW CARS

The Ministry of War Transport announces that it is now possible to start a small allotment of new cars to persons engaged on work of vital national importance and who cannot carry on that work without a car. The number available will be very limited, and deliveries, which should begin towards the end of June, will be made only against licences issued by the Ministry. Existing cars can only be replaced if they are bey
repair.

Applications for licences should be m
to the Ministry of War Transport
Fitzmaurice Place, London, W.1, on
V.C.1 (P.C.), which can be obtained
that address. Particulars should be
of the purpose for which the car is w
and of the car to be replaced. The Regi
Petroleum Officer's reference numbe
the present monthly petrol allowance
be quoted. Delivery of cars will be
through the normal trade channels
prices which will be notified by th
facturers.

HOSPITAL STAFF APPOINTM

The following is the text of a letter
has been sent by the Secretary of the B.
to all hospitals—voluntary, county,
municipal:

DEAR SIR,—

You will recall that in July, 19
Association submitted the following
mendations for the sympathetic co
of all hospital authorities:

(i) No new appointments to the
and specialist staffs of municipal a
tary hospitals should be made
manent basis during the period o
for a period of twelve months
Where it is necessary to make a
ment, it should be temporary and
within twelve months of the con
hostilities.

(ii) It is desirable that the period o
service of an "absentee" practitioner s
be added to the age of retirement in res
of his hospital appointment(s).

(iii) It is desirable that hospital appo
ments of "absentee" practitioners w
would normally be terminated due to a
limit should be continued, the period of
service being added to the age limit in e
case.

The first of these recommendations
been adopted to a very large extent, and the Association wishes to express to hospital authorities its appreciation of their co-operation. The policy of temporary war-time appointments has been endorsed by the Ministry of Health, which normally refuses to sanction a permanent appointment in the public health and school medic services

Now that the European war is over there
may be in some hospitals a desire to
to the practice of making senior h
appointments on a permanent basis.
Association feels strongly that, in f
to medical practitioners absent on n
service, the policy of temporary app
ments should be continued. The same view has been expressed to the Association by the Central Medical War Committee and the Committee of Reference of the Royal Colleges, which have received representations on the subject from doctors serving in the Forces. The words "period of war" in the first of our 1939 recommendations should be regarded as referring to the war with the Axis Powers and not merely to the war with Germany.

There may be *very exceptional circumstances* which may be thought to justify a
permanent appointment. Should such
course be decided upon it is hoped that th
time allowed for the receipt of applications will whenever possible be at least four months in order to permit of candidates serving over-seas being considered, and that real consideration will be given to the applications of Service candidates. It is
able that advertisements of such a
ments should state explicitly that ap
from Service candidates are invite
practice has already been adopted
number of cases. Its general ad
would give much satisfaction to the ser

doctors and would, we suggest, be in the interests of the hospitals. We commend the ractice for favourable consideration by all ospital authorities.

We recommend also that appointments ich it is proposed to make on a per- nent basis should be notified to the edical Directors-General at the Admiralty, ar Office, and Air Ministry in order that ey may be brought to the notice of medical cers through Service channels.

Yours faithfully,
(Signed) Charles Hill,
Secretary.

PLANNING FOR SOCIAL SECURITY

A PEP BROADSHEET

E P (Political and Economic Planning) has sued a broadsheet on certain aspects of e Government's social security proposals h, in the view of the unnamed authors, erve more close-grained discussion than y have yet received." The particular sub- are sickness and unemployment bene- ntributions, pensions, aid for children, ance and administration. On the t of maternity benefits it is pointed hat the suggested maternity grant of £4 ot err on the side of generosity. It not, indeed, cover the cost of a l layette. The inadequacy of this compares oddly with the death grant , which suggests that it costs five times much to get out of this world as it should cost to get into it. In the view of P E P e death grant should be accompanied by the nationalization of industrial assurance, with provision for compensating those who now carry it on and for safeguarding the holders of existing policies against financial loss.

On pensions the authors hold that an improvement on the Government proposals would be to postpone retirement, except in cases of disability, for two years, making pensions available at 62 for women and 67 for men and at the same rates as working age benefits—namely, 24s. for single and 40s. for married persons. But the principle of employing older people, the broadsheet points out, represents a new experiment in emplc nent policy and will call for very careful planning; human beings, after all, annot be treated as obsolescent machinery.

The family allowance of 5s. for each child ter the first is regarded as satisfactory, but 6d. should be paid for the first child. the subject of school meals and free ilk it is assumed that the case of the under-fives will receive further consideration, and the problem of the provision of school meals during holidays might be most economically solved by free milk being delivered at the children's homes.

The new approach in workmen's compensation is welcomed, though attention is drawn to some anomalies in the Government scheme. The method of calculating industrial injury benefit rates gives an advantage to the single man. The provision of a life pension for a childless widow irrespective of her age is also criticized.

Three White Papers

These criticisms apart, P E P considers that a great advance in social security is assured if there is legislation on the three White Papers—those on a National Health Service, Social Insurance, and Workmen's Compensation. "Great Britain will thereby ice herself in the van among the nations his particular field of planning." The cial proposals, P E P continues, are not meticulous copy of the Beveridge plan; ey differ from it in certain important detai , sometimes for the better and sometimes for the worse. But viewing the plan as a whole (children's allowances, medical care for all, and full employment) the Government has adhered pretty closely to the plan to achieve freedom from want with which, two and a half years ago, Sir William Beveridge captured the imagination of the world. The same bold conception is there: social insurance for all, the integration of the various services, and reform along the line of logical evolution from the past—that is to say, from the considerable structure of social insurance and assistance built up by the Governments of all parties since the beginning of the present century. P E P holds that *welfare* is the keynote and the basic principle underlying all the new administration; a Ministry of Welfare would have been a better title than the Ministry of National Insurance.

AS THE NURSE SEES IT

GENERAL NURSING COUNCIL ON HOSPITAL PLANNING

The nurse is often disregarded in hospital planning, yet she is likely to suffer more than the patients or the medical staff if there is bad planning, and her usually practical mind ought to be consulted in the details of construction and equipment. The General Nursing Council for England and Wales has accordingly produced a memorandum on this subject—a highly detailed document. Some of the suggestions might be regarded as obvious, as, for example, that doorways should permit the transit of beds to and from wards, balconies, and single rooms, but, no doubt, in putting these down, some of the nurses speak from sad experience.

On construction of the hospital itself the memorandum urges that soft wood should not be used for floors, such wood being absorbent and therefore dangerous as a source of infection; that turning-points on corridors and stairs should permit easy passage; that lift-shafts should be enclosed to reduce noise; and that wall surfaces should be designed to avoid the accumulation of dust. In the ward an overall unit for one sister should contain not more than 25 beds, however divided; wards should be provided with balconies, adequately lighted and heated, and they should be used solely as balconies, not as an extension of the ward; the absolute minimum distance between bed centres should be 10 ft.; every bed should be provided with a detachable light; suitable flooring, furniture which is easily moved, self-closing doors, and "buffering" between wards and annexes should be installed to eliminate avoidable noise. To prevent cross-infection soiled linen should be removed immediately without being sorted by nurses; and there should be closed, built-in bedpan washers and sterilizers, liberal provision for hand-washing in wards and annexes, and electric light switches which can be turned on and off otherwise than by hand.

The ward annexes should include a treatment unit (minimum 400 sq. ft.), a sister's room, a ward kitchen (minimum 300 sq. ft.), a milk room and feed-storage room in connexion with the children's ward, a linen room, a hot-air cupboard, a patients' wardrobe room, a staff cloakroom, a patient's sitting-room, and waiting-room for visitors. The sanitary annexes should include a clinical room for carrying out tests, an adequate sluice room, a room for storage of sanitary equipment, bathrooms for patients (at least two baths for 25 patients), and w.c. accommodation, at least three for 25 patients, with hand basins in proximity, and more accommodation than this for wards where the majority of patients are up.

Nursing Staff Accommodation

The General Nursing Council also has its views on the structure and furnishing of the nurses' quarters. The nurses' home should have a complete north aspect, proximity to wards, kitchens, boiler-house, and mortuaries being avoided. Single bedrooms should have a minimum of 100 sq. ft., with running hot and cold water and adequate heating and lighting, and there should be bed-sitting-rooms (minimum 140 sq. ft.) for trained nursing staff, with flats or adequate units for senior administrative nursing staff. A nurses' sick bay should include single bedrooms, sitting-dining-room, consulting-room, and treatment room. There should be a minimum of one bathroom to every five bedrooms, and of one w.c., separate from the bathrooms, also to every five bedrooms. Other requirements are separate accommodation for hair washing and drying, with the services of a hairdresser; an incinerator on each floor; a washing and ironing-room and adequate cupboard space; one or more service rooms or kitchenettes on each floor; large well-lighted dining-rooms, with hot-plates, water boilers, tea and coffee urns, and service wagons; sitting-rooms in the vicinity of some green space or garden, separate for sisters, trained staff, and student nurses; a recreation room and facilities for outdoor games, and a visitors' room in which nurses can entertain their friends. There are yet other recommendations for the teaching unit, including large and small lecture rooms, laboratories, a kitchen for the demonstration of cookery, and a practical demonstration room equipped as a ward, none of them to be in a basement. It is obvious that the nurses, if they have their way, will give hospital planners and designers enough to think about.

Correspondence

Physiotherapists and the Board of Registration of Medical Auxiliaries

Sir,—The Council of the Chartered Society of Physiotherapy would not have thought it necessary to comment on the article in the *Supplement* of April 14 (p. 56) had it not been that many medical practitioners are now under the impression that the Chartered Society has withdrawn from the Board of Registration of Medical Auxiliaries as the first step towards repudiating its present relationship with the medical profession, by which its members work only under medical direction.

That impression has been created by the memorandum which the Board sent to the Council of the B.M.A., in which the Board says that, as one of the consequences of the Chartered Society's withdrawal: "At any time the members and Council can amend a condition now existing among their rules, that physiotherapists must treat patients only under a doctor's direction and control. The effect of this action would be that physiotherapists would be in a position similar to osteopaths."

This suggestion is entirely false and unfounded, and in my submission should never have been made. The Chartered Society had entered into this undertaking of its own accord long before either the Board or the Register of Biophysical Assistants were thought of. Its willing acceptance of medical direction is fundamental to its professional ideals, and it values most highly the assistance which medical practitioners give it, both in the deliberations of its council and in the day-to-day performance of its members' work. Secondly, the Society cannot amend its by-laws without the consent of the Privy Council, under whose supervision it works as one of the conditions of its Royal Charter. The mischievous suggestion that physiotherapists could or would place themselves in a position similar to that of osteopaths can only have been made for the purpose of arousing prejudice.

Finally, I would take this opportunity to state shortly the real reasons why the Society seceded from the Board. State registration of physiotherapists is practically certain to come before long. The Council of the Chartered Society is convinced that physiotherapy is a distinct and autonomous profession, and that physiotherapists ought not to be registered by a Board representing other classes of auxiliaries. The Board's register is very incomplete; the Chartered Society's own register is complete. It is not content with a minority representation on the governing body of its profession, and it desires a one-portal system of recruitment, which would not be secured under a composite board. The policy of the Chartered Society is simply to secure an independence of precisely the same kind as that now enjoyed by nurses, pharmacists, solicitors, and the medical profession itself.—I am, etc.,

Herbert L. Eason,
Chairman of the Council,
Chartered Society of Physiotherapy.

A Footnote to "Heard at Headquarters"

Sir,—There are two paragraphs under "Heard at Headquarters" (*Supplement*, May 26, p. 97) which prompt me to comment. "The Proportion of Specialists" refers to their higher proportion in Canada as compared with this country. When Sir Jenner Verrall and I were on a mission to Canada for the B.M.A. in 1924 we called on a friend of his in Toronto, a clergyman's wife, who had been in Canada only a few years, and found the situation when she required a doctor both disconcerting and very expensive. She said it was difficult, if not impossible, to get a family doctor as *she* understood the term, for she was so often told by the doctor she had first employed that she ought to see somebody "who specialized." Her baby, who had been born in hospital (though she would rather have had him at home, but her doctor did not do any midwifery), developed some infantile malady and her doctor said she must call in some man who specialized in that line. The complaint turned out to be measles. There were other episodes which led her to the conclusion that the all-round family doctor as she had known him was almost an extinct species in Canadian cities. I found the same tendency in South Africa, where, I think, the proportion of specialists must be very high. As an old ex-family doctor I cannot think this tendency is a healthy one. Even in London during my official B.M.A. days I found it growing —a tendency by general practitioners to send off to hospital cases which seemed to my untutored mind to be well within their capacity. This largely accounts for the steady growth of the hospital out-patient department among the poorer section, and the liability of the better-off section to ask their friends to recommend "a good man in Harley Street" for complaints which I, and my like, would cheerfully have tackled in my time. The general practitioner must look to his laurels if he does not want to become merely a unit (and one of the low grade) in a team. After all, he is supposed to have had an education which fits him to deal with all branches of his profession and which ought to have made him well aware when he and his patient require a second opinion.

The other point was in the paragraph "The Association's House," where a richly deserved tribute is paid to Sir Robert Bolam for conceiving the plan whereby the new house was to become a beautiful and worthy home for a great Association. I feel, however, that the name of Mr. Bishop Harman should be bracketed with his, for I remember well how useful (if sometimes provocative) he was when the building operations were under discussion. With a keen appreciation of the artistic possibilities of the building he had great ambitions for its future with which he inspired all of us. But, after all, Bolam *was* the master mind which carried the great scheme through, and if ever anyone could say, "If you want to see my monument, look around," it would be Bolam if he could revisit the scene.—I am, etc.,

London, S.W.7 Alfred Cox.

Organization of Psychiatric Services

Sir,—In the *Supplement* of May 19 (p. 93) it is stated that Dr. R. G. Gordon, in presenting to the Council of the B.M.A. a report of the Joint Committee on the Future Organization of a Psychiatric Service, said that "the document had not taken into consideration the work of Services psychiatrists, and he knew that there was some feeling among them that their point of view had not had much opportunity of being expressed." It would be very unfortunate if men in the Services were encouraged to think that their views were disregarded. It is a sufficient answer to state that the Psychological Committee of the Royal College of Physicians, one of the three bodies which jointly produced the report, includes the following Service members: Surg. Capt. D. Curran, Air Cdre. R. D. Gillespie, Major Emanuel Miller, Col. A. A. W. Petrie, Brig. J. R. Rees, Major J. Rickman, Brig. G. Riddoch, Lieut.-Col. J. Ivison Russell, and Air Vice-Marshal C. P. Symonds.—I am, etc.,

W. Russell Brain,
Joint Secretary,
Committee on Psychological Medicine.

The Electorate and the Decisions of the S.R.M.

Sir,—The general report in the *Supplement* of May 12 (p. 88) on the Special Representative Meeting makes sad reading for those who have the independence of the profession at heart. We are told that the Chairman of Council gained much success in his interventions, and that some of the proceedings were humorous. Yet at this very important meeting firm resolutions that were passed by large majorities at the last A.R.M. were thrown away lightly by the enthusiastic State worshippers. Obviously the Minister of Health will have autocratic powers, as he can discriminate in his choice of advisers and disregard their advice. In the future we shall probably get some bad Ministers of Health as in the past we have had some bad kings. In the 17th century there was a long struggle in England to overthrow the "divine right" of kings; now the "State" is claiming a "divine right" (with no popular mandate) to meddle in affairs about which it knows very little.

If the profession would unite to defend the most important bastions of their liberties while they still have political bargaining power all would be well. Once the Bill is passed we lose for ever all effective political weight, and will be at the mercy of successive Governments. But, as a Representative, I saw no chance of unity. We are not selfish nor are we obstructionist, as certain horrible press articles have insinuated with all the blatanc that goes with untruth; the interests o our patients are dear to us; they are pu before our convenience by day and b night. No one, not even one among those of our own profession who a inebriated by political passions, has broug out a reasoned thesis as to just how th chaotic scheme will benefit the health Mr. or Mrs. Everyman. Many of us loo on it as a political racket.

There is a very strong feeling of oppos tion to State control of medicine in t Divisions, which is well shown in th agendas of the last few meetings of t B.M.A.: nearly all the amendments a of a critical or hostile nature. But t feeling is not accurately reflected in t voting on those amendments, as so ma voters were always swayed by speak with great ability, adroitness, and p suasive powers. Future generations servile doctors will fail to see that th was anything humorous about the p ceedings of May 3 and 4, 1945. O negotiating body, which started off w such good work, will now miss the *a tergo* and have a harder task.

In financial matters, which have been slurred over in a most gentlemanly manner, our unhappy young men are trusting entirely to that generosity of the Treasury towards the medical profession of which there has been no sign in the past and there is no likelihood in the future.—I am, etc.,

Hastings. Harry Gabb.

Medical Demobilization

Sir,—During the later years of the last war men as soon as they qualified had to join one of the Services, but their calling-up was postponed for three months provided they held a house appointment. In the present war all those qualifying hold A posts in the E.M.S. for six months and a fair proportion pass on to B2 or even to B1 posts.

It is clear that the release of medical officers in the Forces is in the main dependent on the recruitment of newly qualified men. Many of those who have been in the Forces for several years feel that at the present time no newly qualified practitioner who is medically fit for service should be allowed to remain in any form of post, whether in an E.M.S. hospital or elsewhere, for longer than six months. At the end of that time he should at once join one of the Services and thereby effect the release of a serving medical officer. This policy may for a time cut down the number of men available for house appointments; but this shortage would soon be remedied by those returning from the Services, who would avail themselves of the scheme for holding appointments of the B1 category. In addition, the larger hospitals can dilute their qualified house officers with an admixture of final-year students, a system which to some extent has already been put into practice with success.—I am, etc.,

J. J. Conybeare.

⁂ The Secretary of the Central Medical War Committee states: It is *not* clear that the release of Service doctors will depend mainly on the recruitment of newly qualified men. Such men could not in any case replace the many specialists in the early release groups. As has been explained, the Central Medical War Committee expects to continue recruiting doctors up to an age limit between 35 and 40, though the Government has not yet decided the upper limit. The recruitment of all newly qualified practitioners after six months in A posts is impracticable because released Service doctors will not wish to accept B2 posts. Indeed, in the early release groups there will be few if any Service doctors interested in obtaining B1 posts. Final-year students cannot occupy B2 posts; they can only be allowed limited responsibilities in A posts, and their employment is necessarily confined to hospitals associated with the medical schools.

Proposed Modification of Policy

SIR,—In the planning of the future service certain main considerations are obviously of critical importance. These include the administrative set-up, the conditions and terms of service, security of tenure of practice, and the vexed question of compensation for the loss of goodwill or for loss of market for it. It is felt that these issues, though distinct, are inseparably related, and no plan can be finally acceptable to the profession unless all are agreed in some form or other.

A recent forecast by the Chairman of the Council that there may be a post-war boom in the market for practices gives no assurance as to the more distant future. We know that an extended health service will need a greater number of doctors, and if the services of every available doctor are to be brought into operation in the public interest, it must be decided sooner or later whether entry into such service is to be governed by capacity *to serve* or capacity *to buy*. Only by restricting entrance into established practice to those with capacity to buy can the market for practices be maintained. It must be perfectly clear to the public that no necessary relation exists between capacity to buy and capacity to serve, and that a "good market" for practices can only mean that there are numbers of doctors wanting to enter certain spheres of professional activity but unable to do so unless prepared to expend capital.

Is it likely that the public will for long continue to accept such an arrangement, especially if represented by a Socialist Government? Will not openings ultimately be developed which will absorb any doctor willing to serve? Will not this collapse the market for goodwill by eliminating purchasers? No bolstering of the present system by providing loans at low interest can reconcile the criteria of capacity to serve and capacity to purchase. Moreover, the borrowing of capital mortgages the goodwill to the lender, and if the lender should be the Government this is a matter which should itself excite the attention of the profession.

The Minister of Health has referred to the compensation of doctors for the loss of goodwill in the event of their entering whole-time public service, but no assurance has been given regarding possible loss resulting from a fading market. Further, there is no precedent for compensating loss of market, and to establish such a precedent would lead to all manner of complications. Any business firm might then apply for compensation on the ground that the market for its goods had fallen as a result of some Government decision. Surely it is inevitable that, as was forecast by the Medical Planning Commission, the custom of buying and selling practices will gradually disappear with the introduction of a truly comprehensive service.

Could anything be more disastrous to the profession than such a "gradual" disappearance—the insidious melting away of capital value? It has been suggested that the total valuation of the capital value of practices throughout the country comes to approximately £60,000,000. Whatever the amount may be it represents *a loss that must be met* in the setting up of any comprehensive service which will ultimately obliterate the capital value of the practices. Is it the Government's intention that such a loss should be met by the doctors themselves—that, in effect, the cost of establishing a new service should be met by what would amount to a "capital levy" raised from one section of the community only, not, perhaps, the least worthy section, but, curiously enough, the very section invited to operate the service?

It must be emphasized that this problem cannot be separated from other issues—administrative machinery, security of tenure of practice, etc.—but it is here suggested that provided agreement be reached in these matters, it is essential to the interest of the profession, and only equitable and just, that the custom of buying and selling practices should be abolished at the outset, and compensation granted upon an agreed basis. It is not suggested that such an abolition could be agreed separately from guarantees regarding security of tenure and the other points mentioned above. The question may be asked how vacancies could be filled. This might be achieved by a system of invitation and selection in accordance with a detailed scheme acceptable to the profession as a whole. Space does not here permit more than the statement of a *prima facie* case for abolishing the custom of buying and selling practices, but I urge Divisions to give this whole matter their most earnest reconsideration before the coming Representative Meeting, and it is hoped that opportunity will then be afforded to consider a resolution on the subject.—I am, etc.,

Wrexham. RAYMOND S. BROCK.

The "Home" Hospital

SIR,—The Representative Meeting has ended. Many will be thinking over the arguments and weighing up the results. The future of the health centre, its structure and purpose being still experimental, is vague. Several have suggested to me that now is the moment to put forward again to the readers of the *Journal* the home hospital as the type of health centre which, combined with the home doctor, will help the patient as a member of the family and preserve the integration of the home.

The patient is always in the forefront in our planning; his paramount interest is rather taken for granted in our discussions; the public and the Press do not appreciate this fact. The patient—man, woman, and child—has a body, mind, and soul; he is a social animal with a family and a home, a cultural being with art, science, and leisure for recreation; employable, he gives some service, whether it be advice of profession or products of agriculture, industry, or commerce; and as a political, economic, and ethical man he is the citizen in a community or nation. *Homo sapiens* is a life, but through his course here needs health of body, harmony of mind, happiness of soul. Planning must supply these needs with the greatest foresight, so that the future shall not be sacrificed to present expediency.

It has been well said that foundations must be well and truly laid whatever the architecture or building to be erected thereon. The home, the home doctor, and the home hospital form the primary and right foundations of a National Health Service. The administrative structure is the architecture; the soundness of the building is dependent upon ourselves. Is the present planning topsy-turvy?

The right foundation consists of home as the primary unit of the served, the home doctor as the unit of the server, and the home hospital as the unit institution. The home doctor sees his patient in the home. Its environment of personalities and conditions is observed by him. The patient at his leisure comes to the home doctor's consulting-room to give his history and to undergo an ordinary examination. He is sent, still under the care of the home doctor, for a complete examination if necessary at the home hospital: the home hospital has beds, operating theatres, an *x*-ray department, a pathological department, and consultative clinics for all specialties, including particularly the orthopaedic with physiotherapy and rehabilitation departments. The ambulance service is centred on it. Exceptional cases are taken to the larger hospitals where extraordinary apparatus and especially highly technical knowledge of specialists and various departments are available. Further details of the home hospital might be varied by the demands of different areas. Home hospitals would be placed obviously under the area planning councils or, better, regional plannings council.

It should be clear that if the home doctors and the home hospitals (staffed by family doctors), with consultants readily available, were displaced further by a collateral State service, with their disappearance would vanish the key to a rational health service. Medical personnel require more years for training than great buildings require for their erection. It is not impossible under a State medical service to picture health visitors calling at the homes and driving the cases like robots to clinics (health centres) or larger hospitals.

Readers may be interested to hear that such a home hospital was erected, in which the interest of the local community was such that 85% of the homes contributed towards its erection by natural pride in the development of their own district, that the institution has grown to the value of £60,000, and will expand still more when building can take place. Will such a spirit survive under the new planning?—I am, etc.,

Teddington. P. W. L. CAMPS.

At the annual meeting of the Medical Insurance Agency on May 23 allocations to the medical charities by which they will profit in all to the extent of £5,113 7s. 6d. were authorized. This amount is larger than has been possible during any of the war years, and satisfaction was expressed that the Agency was able to give such help to the charities. Sir Robert Hutchison was re-elected chairman of the Agency, and the following were elected members of the committee of management for the ensuing three years: Mr. N. Bishop Harman, Sir Ewen Maclean, Sir Francis Fraser, Sir Robert Hutchison, Mr. H. S. Souttar, and Dr. G. Roche Lynch.

BRITISH MEDICAL ASSOCIATION

ANNUAL GENERAL MEETING

Notice is hereby given that the Annual General Meeting of the British Medical Association will be held in the Great Hall, British Medical Association House, Tavistock Square, London, W.C.1, on Wednesday, July 25, 1945, at 12.30 p.m. Business: (1) Minutes of the last meeting; (2) appointment of auditors; (3) report of election of President for 1945–6.

CHARLES HILL,
Secretary.

Meetings of Branches and Divisions

NORTH OF ENGLAND BRANCH

Spring Meeting

At the first of a course of scientific meetings held in Newcastle in March, Major-Gen. W. H. OGILVIE chose as his subject the applications of the lessons of war to the surgery of peace. Man, he declared, was a conscious and habitual planner, and it was to be expected that he would attempt to apply the lessons learnt in the vast clinical trial carried out under the more or less standardized conditions of Service life, with access to large numbers of cases, to peacetime conditions. In the treatment of infected wounds primary suture had been tried and found wanting. The method of choice was delayed primary suture when the primary oedema had subsided, after excision of grossly damaged and infected tissue, followed by free drainage. Skin grafting could be practised later when necessary. Chemotherapy was invaluable in the treatment of infected wounds, but it must be remembered that sulphonamides and penicillin were bacteriostatic rather than bactericidal. Early and adequate restoration of blood loss was one of the essentials of first-aid treatment and the plasma-protein level must be maintained.

Speaking on the medico-legal aspects of artificial insemination at the second meeting. Dr. ROBERT FORBES said that allegations of negligence, adultery, or conspiracy to defraud heirs had to be guarded against. The registration of the birth of a child conceived in such circumstances presented certain difficulties, especially when the alien source of the semen was known. Dr. Forbes then outlined the precautions he recommended in the selection of a donor, in the documents to be signed by the donor, his wife when applicable, the recipient and her husband, and in the arrangements to be made for witnessing and recording the operation.

At the third meeting Dr. RAYMOND GREENE described the mechanism of endocrine disorder. He stressed the importance of the hypothalamus as a connecting link between the cerebral cortex and the autonomic nervous system on the one hand and the endocrine organs on the other. This interrelationship between the nervous and endocrine systems was of first importance when considering the cause or treatment of disease of either. To make a true endocrine diagnosis it was not only necessary to determine the gland chiefly affected but also the level of the primary lesion, which was not infrequently in the cerebral cortex. In the study of disease it was more rational to consider the patient as a whole, including the mind, rather than to ascribe the disease to a lesion of a particular organ.

Dr. JOHN INGRAM, in an address on "The Seborrhoeic Problem," said the major seborrhoeic disturbances—pityriasis, the eczema group, and infective eczema with sycosis—should be looked upon not as clinical entities but as manifestations of a well-defined general state. Not only was seborrhoea associated with cutaneous changes such as hyperidrosis, diminished skin and vasomotor tone, chronic minor oedema, increased sensitivity to irritants and decreased resistance to infection, but it was reflected in the patient as a whole. Such a patient, for example, was liable to develop oedematous, catarrhal, and easily infected mucosae, especially in the nose, nasal sinus infection, pyorrhoea and "soft" teeth, gastro-intestinal upsets, debility, evidences of avitaminosis B, and an unstable mentality and nervous state. All these conditions reacted upon the general make-up of the patient and formed the background of the seborrhoeic diathesis.

Before the lectures clinical demonstrations were given by Dr. A. A. McIntosh Nicol, Mr. W. A. Hewitson, Mr. C. Gordon Irwin, Mr. J. Kenneth Stanger, Dr. D. Sage Sutherland, Mr. Weldon Watts, Dr. H. H. Markham, Dr. W. J. Phillips, Dr. E. Walkinshaw Osselton, Dr. P. Ayre, Dr. Winifred M. Houston, Dr. Joan Miller, and Dr. M. Goldston.

H.M. Forces Appointments

ARMY

Col. G. F. Allison, C.B.E., M.C., late R.A.M.C., has retired on retired pay on account of disability, and has been granted the honorary rank of Brig.

Col. J. G. Gill, C.B.E., D.S.O., M.C., late R.A.M.C., having completed four years in the rank, is retained on the Active List supernumerary.

Lieut.-Col. F. Harris, C.B.E., M.C., from R.A.M.C., to be Col.

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. J. T. McConkey, having attained the age for retirement, is retained on the Active List supernumerary.

Major (War Subs. Lieut.-Col.) C. E. Eccles, O.B.E., to be Lieut.-Col.

Major F. McL. Richardson, D.S.O., to be Lieut.-Col.

War Subs. Major J. D. Cruickshank to be Major.

Short Service Commission.—Capt. A. Crook has been granted a permanent commission.

Short Service Commissions.—War Subs. Major J. Duguid and War Subs. Capts. A. Grieve, D. E. S. Steele, F. Lanceley, and I. N. Darbyshire, from Emergency commissions, have been granted Short Service commissions in the rank of Lieut. and to be Capts.

TERRITORIAL ARMY

Cols. P. J. Gaffikin, M.C., T.D., A. M. Johnson, M.C., and C. H. Budd, M.C., having exceeded the age limit have retired, retaining the rank of Col.

ROYAL ARMY MEDICAL CORPS

Lieut.-Cols. H. V. Leigh, O.B.E., and R. G. Gordon, having exceeded the age limit, have retired, and have been granted the honorary rank of Col.

Lieut.-Col. W. W. Hallchurch, T.D., having exceeded the age limit, has retired, retaining the rank of Lieut.-Col.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Major D. R. Allison has relinquished his commission on account of disability, and has been granted the honorary rank of Lieut.-Col.

War Subs. Capts. E. C. Jones and F. L. Cane have relinquished their commissions on account of disability, and have been granted the honorary rank of Major.

War Subs. Capts. B. R. Cumbo, A. E. Brewer, J. W. Bradbury, G. A. Clark, J. Sleigh, H. Macpherson, M. Shalet, D. F. Ross, D. J. Fraser, J. A. M. Robertson, A. E. Delgado, and C. D. Gun-Munro have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

Lieuts. H. R. Blades and P. O'F. Boyle have relinquished their commissions on account of disability, and have been granted the honorary rank of Lieut.

To be Lieuts.: L. A. Gibbons, M. K. Fleischer, J. T. C. Sims-Roberts, A. T. D. Whitfield, H. D. Strebrny, A. Attwood, J. T. Blois, D. B. Bradshaw, D. Cappon, I. McC. Carmichael, K. R. J. Coates, T. G. Crombie, E. W. W. Ellis, A. G. Ensor, A. B. A. Evans, D. Goodwin, W. S. Hamilton, E. V. Henton, C. C. Kennedy, G. Kohn, K. W. Leech, M. R. Liver, J. D. M. Lytle, J. W. McConachie, R. S. Monro, W. S. Morgan, D. G. Munro, T. R. Nelson, T. C. Noble, T. Parkin, J. H. Randall, J. M. Scott, J. F. N. Sidebotham, P. J. Spencer-Phillips, R. M. C. Tyner, J. M. Wilson, H. W. Woolner, R. J. Last, J. J. Seide, and T. A. Don.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

War Subs. Capts. (Mrs.) A. English and (Mrs.) M. P. Paterson have relinquished their commissions.

War Subs. Capts. (Miss) C. R. C. Maclean and (Miss) E. H. Williams have relinquished their commissions on account of disability.

Lieut. (Miss) F. R. Hendeles has relinquished her commission on account of disability.

The following M.O.'s have been granted commissions in the rank of Lieut.: Audrey M. Dealler, Sheila D. Lee, Katherine I. Liebert, Margaret W. Macgregor, Mona Mitchell, Isabella M. Pinkerton.

ROYAL AIR FORCE

Wing Cmdr. T. J. X. Canton has retired and has been re-employed.

Wing Cmdr. W. F. Wilson, M.C., has reverted to the Retired List at his own request.

Fl. Lieut. (Temp. Wing Cmdr.) J. R. R. Jenkins to be Squad. Ldr.

RESERVE OF AIR FORCE OFFICERS

Squad. Ldr. (Temp.) J. D. Milne has been granted the rank of War Subs. Squad, Ldr.

Fl. Lieut. (Temp. Squad. Ldr.) R. A. W. Kerr has relinquished his commission on account of medical unfitness for Air Force service, retaining the rank of Squad. Ldr.

AUXILIARY AIR FORCE

Squad. Ldr. C. W. Kidd has resigned his commission, retaining the rank of Wing Cmdr.

Fl. Lieut. (Temp. Squad. Ldr.) J. E. La Frenais has relinquished his commission on account of medical unfitness for Air Force service, retaining the rank of Wing Cmdr.

ROYAL AIR FORCE VOLUNTEER RESERVE

Wing Cmdr. J. G. Stewart has resigned his commission, retaining his rank.

Squad. Ldr. (Temp. Gp. Capt.) R. D. Gillespie has relinquished his commission on account of medical unfitness for Air Force service, retaining the rank of Air Cdre.

Squad. Ldr. (Temp.) J. A. Lennox has been granted the rank of War Subs. Squad. Ldr.

Fl. Lieut. (Temp. Squad. Ldr.) G. A. Strain has resigned his commission, retaining the rank of Fl. Lieut.

Fl. Lieut. A. C. Turner has relinquished his commission on account of medical unfitness for Air Force service, retaining his rank.

Fl. Lieuts. W. L. Hardman and J. R. Colville have resigned their commissions, retaining their rank.

H. A. C. Chalmers to be Fl. Lieut. (Emergency).

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1) Week-end course in ear, nose, and throat diseases, at Metropolitan Ear, Nose, and Throat Hospital, all-day, Sat. and Sun., June 30 and July 1; (2) Week-end course in obstetrics and gynaecology at South London Hospital for Women, all day, Sat. and Sun., July 14 and 15; (3) Week-end course in medicine and surgery at Hampstead General Hospital, all-day, Sat. and Sun., July 21 and 22; (4) Primary F.R.C.S. course: lecture-demonstrations in anatomy, physiology, pathology, and immunology, Mon., Wed., and Fri., from 6 p.m. to 8.15 p.m., Aug. 13 to Oct. 12. Full particulars from the Fellowship of Medicine, 1, Wimpole Street, London, W.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, London, W.—*West End Hospital for Nervous Diseases:* Mon., Tues., and Fri. 2.30 p.m., M.R.C.P. course in neurology. *North Middlesex County Hospital:* all-day, Sat. and Sun., June 16 and 17, Week-end course in general surgery (limited).

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m., Mr. W. Quarry Wood: Treatment of Duodenal Ulcer.

DIARY OF SOCIETIES AND LECTURES

ROYAL COLLEGE OF SURGEONS OF ENGLAND, Lincoln's Inn Fields, W.C.—*Thurs.*, 4 p.m., Hunterian Lecture by Col. Elliott C. Cutler: Military Surgery, U.S. Army, 1944-5 (amended title).

ROYAL SOCIETY OF MEDICINE.—*Tues.*, 5 p.m., Section of Experimental Medicine and Therapeutics; 5 p.m., Section of Psychiatry. *Fri.*, 5 p.m., Section of Obstetrics and Gynaecology.

CHADWICK TRUST.—At Chelsea Physic Garden, Swan Walk, Chelsea, S.W., *Thurs.*, 4 p.m., Mr. C. J. Layton: Health and Horticulture.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. for 18 words or less. Extra words 3s. 6d. for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.

BIRTHS

McCALL.—On May 25, 1945, at Stoke-on-Trent, the wife of Dr. A. J. McCall, a daughter.

McDOUGLE.—At Edinburgh, on April 18, 1945, to Margo, wife of Capt. H. A. McDougle, R.A.M.C., B.L.A., a daughter.

PIERCE.—On May 11, 1945, at Keighley, to Nancy (*née* Whitaker) and Fl. Lieut. H. L. Pierce, R.A.F.V.R., a son.

MARRIAGE

HUNT—KIRK.—On June 2, 1945, at Nottingham, Arthur William Maurice Hunt (Lieut., R.A.P.C.) to Ursula Mary Kirk (Lieut., R.A.M.C.).

DEATHS

GRANT.—On May 31, 1945, at Craigleven, Ballachulish, Argyll, Lachlan Grant, M.D., D.P.H., F.R.F.P.S., J.P., in his 74th year, beloved husband of Catherine Clark.

O'BRIEN.—On May 23, 1945, at "Brierfield," 49, Pollard Lane, Bradford, Yorks, P. M. O'Brien, M.B.Lond., M.R.C.S., aged 83. R.I.P.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY JUNE 16 1945

MEMORANDUM ON THE FUTURE ORGANIZATION OF THE PSYCHIATRIC SERVICES

PREPARED JOINTLY BY

THE ROYAL COLLEGE OF PHYSICIANS
THE BRITISH MEDICAL ASSOCIATION
AND
THE ROYAL MEDICO-PSYCHOLOGICAL ASSOCIATION

The Royal College of Physicians, the British Medical Association, and the Royal Medico-Psychological Association have each been concerned during the past year with the formulation of their views on the future of psychiatry. The views expressed by each of them followed such similar trends of thought that it was considered that a single memorandum would be of more practical use to the medical profession generally and to other persons concerned with the organization of psychiatric services in a National Health Service. The present memorandum has accordingly been prepared jointly by the three bodies.

I. THE LINKS BETWEEN PSYCHIATRY AND GENERAL MEDICINE

1. During recent years psychiatry has been brought into an increasingly close relationship with general medicine. There are many reasons for this. Historically, psychiatry developed as the method of treatment of those individuals whose mental illness necessitated their segregation from the rest of society. It is now recognized that this distinction, however important socially, is medically irrelevant, for there is only a difference of degree between the majority of patients in mental hospitals and the far more numerous sufferers from less severe mental disorders. For one case of major mental illness there are many cases of minor mental illness. In terms of the numbers of patients involved much more psychiatry therefore needs to be done outside than inside the mental hospital. At the same time psychiatry has shown that it has much to contribute to research into the causes and treatment of many forms of illness formerly regarded exclusively from the medical or surgical standpoint. It has thus a double justification for its presence in the general hospital.

2. Moreover, the historical association of the mental hospital with severe forms of illness and with legal restraint has undoubtedly made the public reluctant to avail themselves of these institutions and has militated against the early treatment of mental illness. Although modern developments in mental health services are doing much to lessen such fears and prejudices among the public, they are still a factor to be reckoned with. It has happened that the movement to open psychiatric departments in general hospitals has coincided with the development of methods of treatment which have made it possible to treat successfully as out-patients some mentally ill persons who a few years ago would have become ill enough to need in-patient treatment. Events have thus lent their support to the movement to emphasize the links between psychiatry and general medicine to the advantage of both. It is desirable that this process should continue, and though in certain important respects, described in the next section, psychiatry requires special conditions, it is vital that in any future organization of medicine psychiatry shall not remain segregated. It should take its place in the general scheme and be subject to the same central direction as all other branches of medicine, even though a special internal organization may be necessary.

II. THE SPECIAL FEATURES OF PSYCHIATRY

3. The argument for treating psychiatry in all essential respects like other branches of medicine is in our opinion strong and conclusive. We ought to consider, however, whether there are special features in psychiatry which might weaken this opinion and necessitate some departure in the case of psychiatry from the general pattern of medical services. Although there are special features in psychiatry, it is not certain that they are of this essential kind. There are, for instance, the vagueness and extent of the territory covered, the large number of chronic sick needing hospital care, the reluctance of some patients to seek treatment, and the cost and risk or uncertain application of some current methods of treatment. These are likely to persist for so long a time that they seem almost inherent in the subject. There are other characteristics that need not influence the future place of psychiatry in the medical services, except during a transition period.

4. Where psychiatry begins and ends has not been settled. With the development of preventive medicine, its borders will become less rather than more definite. The study and treatment of delinquency, for example, has given psychiatry an active share in criminology, and the existence of the maladjusted and the poorly endowed child is the obvious but not the only reason why education is as closely linked with psychiatry as psychology is with both. It is true that no branch of medicine has sharply defined boundaries. The surgeon may encroach on the physician's sphere; the public health expert has to concern himself with engineering and housing. But psychiatry has less definite boundaries and marches with more non-medical territories than any of these. It follows that psychiatry must make even fuller provision for liaison than other branches of medicine, though its problem in this respect is fundamentally the same as theirs.

5. The psychiatrist's work is bound up with ancillary services. He requires the professional aid of the psychiatric social worker and the psychologist (in addition to the occupational instructors, speech therapists, and other auxiliaries whom his colleagues may also employ). But here, too, the difference between him and his medical colleagues in other branches is only one of degree; although he is more dependent than they on knowledge of the patient's history and surroundings and on skilled assistance in making the necessary changes in the environment, it is being increasingly recognized in all branches of medicine that social, familial, and industrial factors must be taken into account and appropriate trained help be invoked.

6. More significant differences derive from the attitudes of mind taken up by the mentally ill, the limitations of the mentally defective, the protracted nature of much mental illness, and the unalterable incapacity of the imbecile and idiot. In no other branch of medicine are there so many patients who are unwilling to accept or incapable of seeking suitable advice, who do not co-operate in treatment, and who continue for many years—decades or even a lifetime—to require special care and medical supervision. It is thus harder and yet more essential to ascertain illness early and to retain the patient's trust, once it has been won, than in most other branches. Otherwise the illness will not come under notice until it is grossly manifest or inveterate, and the patient may have to be forced, for the sake of others if not his own, to submit to treatment which he distrusts or resents. Hence the legal enactments (which at some cardinal points have outlived their usefulness); hence also the need for psychiatrists, when undertaking such non-therapeutic functions as certification for insurance purposes or expert testimony in courts of law, to do everything possible to safeguard the patient's belief that his confidence will not be abused.

7. There are an exceptionally large number of mentally sick who require continued hospital treatment. A large number of patients in mental hospitals will have been there for more than three years; some will have been there for ten years or more and some for twenty years or more. The proportion of the general population requiring treatment in mental hospitals is 3.9 per 1,000. It is important to note that mental hospitals cannot get rid of their failures. In institutions for mental defectives the average stay is even longer than in mental hospitals. This long duration of treatment constitutes a major peculiarity of mental illness. It becomes even more striking when chronic neurotics and psychopathic criminals are also taken into account, but since these do not require large hospitals, the chronicity of their illness does not create so evident a problem as faces the huge hospitals, usually some distance from the centres of population, in which are housed and treated those requiring continued treatment, "institutional" defectives, and the more acute, remediable, or trainable patients. If it were not for these long-standing cases, the peculiar problem of the mental hospitals would have been far less with us. Comparable statistics about the relative numbers of chronic and acute cases needing hospital care for other than mental illness would illustrate this, but unfortunately such data are not accessible, except for certain special conditions—e.g., tuberculosis. Too much can be made of the special attributes of the mental hospital problem; it is not its dimensions

that differentiate it somewhat from other hospital problems, but its necessary emphasis on the chronic patient and on the unwilling patient. Chronicity is a difference only of degree; the problem of the unwilling patient is steadily diminishing, although not to vanishing point, with the increasing number of voluntary patients.

8. The number of doctors with the standing of specialists in the psychiatric field is greater than in other special branches of medicine. This is because the number of mentally ill persons who have to be treated in special hospitals is large and the doctors treating them have devoted themselves to this special work for many years. Most of them hold the appropriate diploma. Nevertheless, many of these practitioners do not possess the status and experience which would justify the description of consultant in the ordinary usage of that word. The difficulty is not inherent in psychiatry but is rather due to the present unfortunate cleavage between those treating the psychoses and those treating the neuroses and physical illness. It is a remediable situation which will disappear with the disappearance of that cleavage.

9. Reference has been made to those attributes which are relics of a period now lying behind us in which the extremes represented by the psychiatrists of the mental hospitals and psychotherapists were as far apart in methods, outlook, and experience as could well be. On the extra-institutional side of the rift there were also the public with their fears and beliefs about "nerves" and madness, the neurologist long accustomed to take a share in dealing with psychiatric problems, and the rest of the medical profession scantily educated in the broader aspects of psychological medicine. Hence there are two main differences which arise in considerable measure from the old partition between mental hospital psychiatry and the rest of psychiatry. First, the public still regard the mental hospital with unwarranted dread and the psychotherapist with unwarranted derision or awe. Secondly, many doctors who are not psychiatrists are insufficiently informed about good psychiatric practice and the extent to which they can apply useful psychiatric principles in their daily work. Further, the bulk of the nurses in mental hospitals have not had an all-round nursing training, nor general nurses any training in the psychiatric side of their work. The nursing problem is of great importance, but it need not be discussed further here.

10. Two other obvious differences of the same origin need no emphasis. First, the medical staff of psychiatric hospitals are in many instances full-time employees of a local authority, whereas the non-institutional psychiatrists have been wholly or largely engaged in private practice. This cleavage has been unfortunate. Secondly, psychiatrists in the mental hospitals do their work under the general supervision of the Board of Control, which has had comparatively little to do with psychiatrists working in out-patient and in-patient departments of teaching hospitals, in nursing homes, neurological hospitals, psychotherapeutic clinics, and consulting-rooms.

III. THE FUTURE ORGANIZATION OF PSYCHIATRY: GENERAL PRINCIPLES

The General Practitioner

11. Since we wish to emphasize the close connexion between psychiatry and other branches of medicine it is natural to begin with the general practitioner who is the first to see most patients suffering from mental illness. As elsewhere in medicine patients may be seen in the routine of practice or as acute clinical emergencies.*

(i) *The Routine of Practice.*—Psychiatric education of the medical student such as is recommended in the first interim report of the Royal College of Physicians Committee and the report of the British Medical Association Committee on Mental Health will enable him to treat a considerable proportion of the cases of minor mental illness in his practice on his own responsibility. In other cases he will seek further advice concerning (*a*) diagnosis, (*b*) treatment, or (*c*) disposal. These patients he will refer as he does others to the nearest out-patient consulting centre.

(ii) *The Emergency Case.*—With better education of the general practitioner and better diagnostic facilities fewer patients will first be seen in a condition requiring immediate admission to mental hospitals, but such cases will always arise. For these a domiciliary psychiatric consulting service should be available, linked with the local out-patient consulting centre and/or psychiatric unit. Suitable admission wards will still be required.

Other Sources of Patients

12. Brief mention must be made of other channels through which patients suffering from mental illness may be brought to light. They include industrial medical officers, school medical officers and educational psychologists, psychiatrists attached to courts of law and prisons, the psychiatrists of child guidance clinics and centres, etc. These raise no special problems since it should not be difficult to link them with the proposed consulting centres, though in some cases the actual consulting units may more conveniently be situated elsewhere.

The Out-patient Consulting Centre

13. In all general hospitals of more than 100 beds with recognized consultants on their staffs there should be out-patient consulting centres staffed in much the same way as that recommended in the first interim report of the Royal College of Physicians Committee for the psychiatric department of the teaching hospital. Where a mental hospital is readily accessible this may be used in addition. In very large centres special psychiatric hospitals should be available, and it may sometimes be thought desirable to set up consulting centres under their own roofs.

In these out-patient centres there should be facilities for diagnosis, and for such treatment—psychological and other—as can suitably be given to out-patients.

In-patient Treatment

14. (i) *Emergency Cases.*—Emergency cases will need to be admitted to special wards either in mental hospitals or in general hospitals specially equipped for the purpose.

(ii) *Other Patients.*—In-patient accommodation for other patients will be provided as hitherto in mental hospitals and mental deficiency institutions and in special neurological and psychiatric hospitals, and should be provided without delay in the psychiatric departments of all teaching hospitals and in the larger non-teaching provincial hospitals.

(iii) *Protracted Cases.*—Much in-patient accommodation will always be required to deal with the irrecoverable case. Protracted cases of this sort should be reviewed at regular intervals more systematically than has hitherto been customary, in order to see whether the patient can be socially rehabilitated by means of the increased use of boarding-out methods and of the "colony" system in vogue in Belgium, provided that these can be adequately forthcoming with suitable safeguards.

IV. THE ADAPTATION OF EXISTING FACILITIES

15. Apart from private mental hospitals, "licensed houses," approved homes, nursing homes, and pay-beds in voluntary hospitals, the provision for mental illness may fall under the following heads:

In-patient:
(i) Public and State mental hospitals and mental deficiency institutions.
(ii) Registered hospitals and in Scotland the Royal Mental Hospitals.
(iii) Acute reception hospitals (early treatment units).
(iv) University clinics as in London and Edinburgh.
(v) Special neurological and psychiatric hospitals.
(vi) Units in teaching hospitals.
(vii) Beds in some non-teaching hospitals.
(viii) Accommodation for children.

Out-patient:
(i) At teaching, voluntary, and municipal hospitals.
(ii) At health centres, if and when they are established.
(iii) At special neurological and psychiatric hospitals, including mental hospitals or clinics dealing with child-guidance, psycho-analysis, the treatment of delinquency, and other special psychotherapy.
(iv) As part of other large services—e.g., prison medical service, school medical service, industrial medical service.

16. In the matter of staffing and organization there are two main divisions. Usually the doctors engaged specially in psychiatry are either full-time officers of local authorities or part-time members on the honorary staffs of voluntary organizations. The two groups have dealt in the main with different types of illness in different types of hospital. In spite of many demerits and handicaps this arrangement presents a less formidable problem of integration than would a duplicated system, for the existing services are complementary rather than parallel. The difficulty is to ensure that psychiatrists who have been limited hitherto to one or other field shall be enabled to work in both. Whatever steps are taken to link municipal and voluntary hospitals they will be adequate in respect of psychiatry only if the arrangements allow psychiatrists in mental hospitals to engage actively in out-patient and domiciliary work, preferably in the psychiatric departments of voluntary and municipal general hospitals, and allow psychiatrists in voluntary hospitals to hold appointments on the staffs of mental hospitals. It is suggested that in the case of a teaching hospital a good working arrangement would be to appoint the physician in charge of the psychiatric department to a senior post at the mental hospital, where he would hold, say, two regular half-day clinics a week and supervise a special unit. At the same time the senior clinician in the mental hospital should have a comparable post at the teaching hospital. More junior mental hospital doctors should be appointed as registrars or clinical assistants in general hospitals, where they would take part in

---

* Although it is fully recognized that the part played by the general practitioner in the diagnosis and treatment of mental illness is becoming increasingly important, the subject is not dealt with in detail in this report.

the work of the psychiatric out-patient department. Such an interchange between psychiatric staffs of mental and general hospitals would be less difficult if all hospital medical staffs were remunerated and if domiciliary work became a recognized part of the hospital service. Unless arrangements on these lines are made there is a danger that psychiatrists on the staffs of general hospitals, both voluntary and municipal, will ignore or be unaware of the opportunities offered by mental hospitals and the progress in therapy and research being made in them.

17. It is suggested in the White Paper that consultants and specialists should normally be based on the hospital. This may conflict with the customary tenure of full-time mental hospital posts under the local health authority. It need not, and there is no reason why in this matter the appointment of members of mental hospital staffs should not, be put on all fours with that of consultants and specialists in all other branches of medicine. The strongest efforts should be made to prevent caste differences developing, or being perpetuated, between the "specialists" of what are at present local authority services and the "consultants" of the "voluntary" services, irrespective of whether these are controlled by the same local or regional health authority or not. Such mingling of staffs as is here advocated can be attained only if the organization and mode of appointment is modified, especially in the direction of making the hierarchial structure of local authority staffs less rigid and pyramidal.

18. For this to be effected it might be necessary to amend the law. If, however, psychiatry is to progress and take its place with the other branches of medicine, legal changes going beyond those incorporated in the Mental Treatment Act, 1930, are imperative. In our proposals we assume that such changes would be realized, in addition to those already implemented.

19. In the foregoing no special consideration has been given to the university clinic. It is assumed that in most university centres this will be either a unit of the teaching hospital, of adequate size, or a special hospital contiguous to and closely associated with the main undergraduate teaching hospital. It will then not differ in its staffing arrangements from other special departments of the hospital. An appointment as house-physician in it should be as much part of the first year's work after qualifying as an appointment in the department of medicine, surgery, or obstetrics. It is not assumed that every such psychiatric department will undertake advanced postgraduate teaching and research. Experience has shown that there are many objections to combining undergraduate and advanced postgraduate instruction in the same hospital. If advanced postgraduate work in other branches of medicine is concentrated in a few main centres, this should obtain also in psychiatry. This does not in any degree preclude the carrying out of research work in any psychiatric hospital or clinic, any more than it would in other branches of medicine.

V. ADMINISTRATIVE ARRANGEMENTS

20. There is everything to be said for making the administrative structure of psychiatry exactly the same in principle and even in major detail as that of other branches of the health services. As has been pointed out in the discussion of the peculiarities of psychological medicine, no radical divergency is warranted. Where it exists it must be eliminated. The prominence of the prolonged need for treatment is paralleled in kind by other forms of illness prone to persist; the number of unwilling patients who have at present to be certified by a strict legal procedure is diminishing, and if the law in regard to mental illness were to be modified, they would become a minor problem not necessitating any main departure from ordinary medical administrative structure. We emphasize, however, that the attitude of the public to the psychiatric services is an urgent problem calling for much educational activity. Safeguards for ensuring that the public shall have full confidence in this medical service will have to include the approximation of mental hospital nursing and other features to those of other hospitals. Adequate care is necessary to ensure that the psychiatrist shall not be required to act as a functionary giving certificates, pronouncing on mental state, fitness for work, etc., in such circumstances as would conflict with his therapeutic functions and the patient's confidence in his discretion and reticence. By the nature of his clinical task the psychiatrist needs the complete trust of his patients, who must entrust to him intimate details of their lives; he would be hampered immeasurably, and the good repute of medicine as well as of psychiatry would suffer, if he were compelled to disclose such confidences. The matter will require a close consideration of the balance that must be preserved between the psychiatrist's obligation to the community at large and his obligation to his individual patient; the principles will be the same as apply to other branches of medicine, but their application in psychiatry raises delicate issues.

21. In the White Paper on a Comprehensive Health Service it is proposed that the central administrative structure should be responsible for all civilian health services and that there should be an advisory committee (Central Health Services Council) to represent *inter alia* specialist medical practice and hospital organization; similar advisory bodies are proposed for local health areas. In psychiatry, perhaps more than elsewhere, an active and independent professional advisory body is a vital need; and on this body academic and consultant opinion should be adequately represented as well as other branches of the specialty.

22. There should be a special department of the central health authority which would have to deal with and administer all branches of mental health, and this should be represented, for administrative purposes, throughout the local organization. In the past the Board of Control has provided a separate organization for co-ordinating mental health matters. The new department now suggested would include many of the present functions of the Board of Control, especially in so far as it will be necessary indefinitely to keep a watching eye on the legal aspects of psychiatry. Whilst the head of this department should be a psychiatrist, there will have to be also legal members for reasons similar to those which will no doubt operate in other branches of medicine in which forensic problems frequently arise.

23. This special arrangement for the co-ordination and direction of psychiatric work is necessary because of the many intricacies of the subject—technical, sociological, and legal. Until there has been a radical change for the better in medical education it will be quite impossible for the development of psychiatry to be undertaken by those without special knowledge. If the mental health services of the country were to be directed and administered by those without specialized training the integration of psychiatry into the whole medical structure which we so much desire would be frustrated.

24. Presumably, the principal medical officer of the National Health Service who will be advising the Minister will himself be advised by various senior officers concerned with clinical services, preventive medicine, etc., and it is at this level that the directorate of mental health fits in. At the periphery the administrative officers of mental health would have direct access to this senior medical officer of mental health in the central administration as well as the necessary relations with the area authorities. In this way the social and preventive aspects of psychiatry will be given full opportunities for development.

VI. RECOMMENDATIONS

We submit the following recommendations:

Scope of Psychiatry

1. Psychiatry is not a limited specialty. It permeates and influences general medicine, surgery, and obstetrics and gynaecology. In particular, psychiatrists should be appointed to the staffs of general hospitals with status equal to that of other physicians and surgeons.

2. The mental health department of the health service of the future should be responsible for the organization of all medical work which is essentially psychiatric. This will necessitate certain legal changes.

3. The psychiatrist is not concerned only with fully developed mental disorders. The mental health service should include provision for prophylaxis of mental disorder over the widest field.

4. In the educational sphere psychiatric advice is essential for children showing neurosis, behaviour disorder, or mental defect.

5. In industry a full and efficient consultative psychiatric service should be available, which should work in close co-operation with the patient's doctor and the industrial medical officer. Psychiatrists should co-operate with industrial psychologists in the investigation of industrial fatigue and ill-health, working hours and conditions, incentives, personnel management, etc.

6. Psychiatrists should co-operate in the work of vocational guidance and selection, an essential part of which is the assessment of personality and temperament.

7. Psychiatrists should take part in the rehabilitation of patients after accident or illness. This work should be carried out in close liaison with employers, workers' representatives, and patients' doctors, and any necessary adjustment should be made in the patient's employment on his return to work.

8. There are many other fields in which the psychiatrist should play his part, such as sociological investigations and education in sexual matters.

Administration and Staffing

9. The main factors which retard progress in the treatment of mental disorder at the present time are: (1) the law, which lags behind enlightened public and medical opinion; (2) the mental hospital buildings, many of which are quite out of date, having been designed for detention and safety without sufficient vision regarding curative treatment; (3) the association of public assistance with mental hospital

treatment; and (4) the numerical inadequacy of the medical staff and the numerical and professional inadequacy of the nursing staff in mental hospitals. Improvement is necessary also in the status, pay, and conditions of service of the medical staff, with greater freedom in regard to professional matters and the formation of medical committees. Increased opportunities for purely clinical work should be developed.

10. There should be formed a mental health authority with appropriate statutory powers in each area throughout the country as may be decided hereafter by the Government, such authority to be responsible for all aspects of mental health—i.e., to take over the work of committees of visitors, the committees under the Mental Deficiency Acts, and child psychiatry (including child guidance). Mental health authorities should consist of elected and co-opted members. Close co-operation should be maintained between these authorities and the public health and education committees and those responsible for the voluntary hospitals.

11. On any local advisory bodies, such as the local health services council, there should be adequate psychiatric representation. No doubt such councils will appoint special mental health subcommittees with power to co-opt.

12. Large areas are preferable to small areas. Each area should be of sufficient size to warrant the setting up of a complete mental health service.

13. All matters appertaining to mental health administration should be removed from public assistance.

14. There should be a special psychiatric department of the central health authority to deal with and administer all branches of mental health; this arrangement should be reproduced for administrative purposes throughout the local organization. In the past the Board of Control has provided a separate organization for co-ordinating mental health matters. The work of the new central department now suggested would include in general the present functions of the Board of Control, especially in so far as it will be necessary indefinitely to keep a watching eye on the legal aspects of psychiatry. Whilst the head of this department should be a psychiatrist, there will have to be also legal members of the staff, for reasons similar to those which will no doubt operate in other branches of medicine in which forensic problems frequently arise.

15. A special medical officer should be appointed in each area as adviser and executive officer to the mental health authority of whatever body co-ordinates all branches of mental health. He should be an officer of senior status with clinical and administrative psychiatric experience. He should have reasonable security of tenure.

16. Unless and until the mental hospitals and mental deficiency institutions are organized on the same lines as the voluntary hospitals there should be a medical superintendent in charge of each hospital who should be in continual touch with the clinical aspects of the hospital and its patients. The position which imposes complete legal responsibility on medical superintendents for all patients in the institution under their care should be reviewed.

17. In each hospital there should be a medical committee composed of members of the staff, including visiting consultants. The views of the medical committee on medical and administrative matters should be transmitted to the controlling lay authority, normally through the medical superintendent, who should have a duty to convey them.

18. The facilities for out-patient treatment of adult mental illness require much extension. Clinics should be available in every part of the country. Most cases of psychoneuroses can be treated in well-organized out-patient clinics.

19. Observation wards should be upgraded into early treatment units, which should be departments of, or readily accessible to, general hospitals, voluntary or municipal.

20. There are a number of cases of psychoneurosis which need more intensive treatment and/or closer supervision than can be arranged at a general hospital. For these special hospitals should be provided under psychiatric direction, with nursing staff of special training and experience. For chronic psychoneurotics provision should be made in special hostels, not in the psychiatric wards of general hospitals.

21. It is essential for the proper understanding of all cases, including those of somatic disease, for medical students to be taught a suitable psychology in the intermediate stage as well as the principles of psychological medicine in the final course. At least one question on psychological medicine should be asked in the general medicine examination. Clinical psychiatry should form a definite part of the clinical examination. Teaching and examining bodies should be urged to raise the standard in clinical experience of psychiatry to the level of the kindred subjects of medicine, surgery, obstetrics, and gynaecology. (See first interim report of the Royal College of Physicians Psychological Medicine Committee.)

22. There should be a co-ordinated system of psychiatric social service. All psychiatric social workers should receive such training as will fit them for service in all branches of the specialty. They should take an active part in adjusting environmental difficulties, especially in relation to industry and education.

23. Non-medical psychologists should be employed more extensively and should work in the closest possible co-operation with psychiatrists, but they should not carry out psychotherapy.

24. Facilities for adequate grading should form a basic principle in future administrative arrangements for the treatment of psychiatric patients of all types (including mental defectives), bearing in mind the disadvantages that may accrue from the segregation of chronic patients, except possibly for senile cases, in a separate institution. Patients certifiable under the Mental Deficiency Acts should not be admitted to mental hospitals unless there are overriding psychotic symptoms.

25. The patient should be enabled to use the financial benefits to which he is entitled under insurance legislation, in order to supplement his private means so that he can obtain the treatment of his choice.

26. The status of mental nursing should be equal to that of general nursing. All general nurses should receive some training in psychiatric nursing.

Psychoses and Psychoneuroses

27. Dependent on the area and density of the population to be served, mental health services other than those provided by the general practitioner should be supplied by means of the mental hospital and psychiatric units. That part of a general hospital, whether in- or out-patient department, which is set aside for the treatment of mental disorders, with or without any legal formality, should be known as a psychiatric unit.

28. An adequate number, generally 5%, of beds should be available in general hospitals where a psychiatric out-patient clinic is held regularly, provided that the hospital makes adequate provision for suitable nursing.

29. In larger centres (especially university towns) special psychiatric units should be established, with facilities for both out-patient and in-patient treatment, teaching, and research. The immediate establishment of such units is urged as being eminently practicable.

30. The mental hospital will continue to be the main unit for the provision of in-patient services and must be maintained at the maximum efficiency in staff and equipment. Both the medical and nursing staffs should be materially increased, in some cases by 100%, over the low pre-war standards. Adequate laboratory and other services should be available and liaison should be maintained with general hospital services. All the members of the appointed medical staff should take some part in extra-mural duties—e.g., out-patient, convalescent (rehabilitation) homes, and in a consultative capacity at health centres. There should be posts for house-physicians at all mental hospitals. These should be taken up after the usual house officer appointments have been held in a general hospital. Some experience in general practice is a valuable preliminary to training in psychiatry.

31. All suitable existing hospitals, such as registered hospitals, licensed houses, and, in Scotland, the Royal Mental Hospitals, should continue to be used either for patients under the National Health Scheme or for private patients, and advantage should be taken of all material for teaching and research.

32. The amendment of the Mental Treatment Act (1930) is urged so that under Section 5 all non-voluntary admissions may be received for the purpose of treatment and detained for a period not exceeding six months, with possible extension by the department of mental health, without a Reception Order. This involves the omission of all reference to "willing or unwilling to receive such treatment."

33. While it is desirable that the great majority of psychoneurotics should not be treated in mental hospitals, a certain number may be admitted, dependent on the degree of disorder and abnormality of behaviour and the sensitiveness of the patients to their surroundings. With due regard to the foregoing, this would entail that the mental hospitals should be so reorganized as to provide suitable facilities for in-patient treatment for all types and degrees of mental ill-health, including neuroses, by the provision of suitable separate units (where necessary of new units) to guarantee adequate grading. This would also involve appropriate training of medical and nursing staff.

34. Legislation and accommodation are required so that drug and alcoholic addicts and other antisocial psychopaths may be detained under some form of order for periods sufficient to permit of adequate treatment.

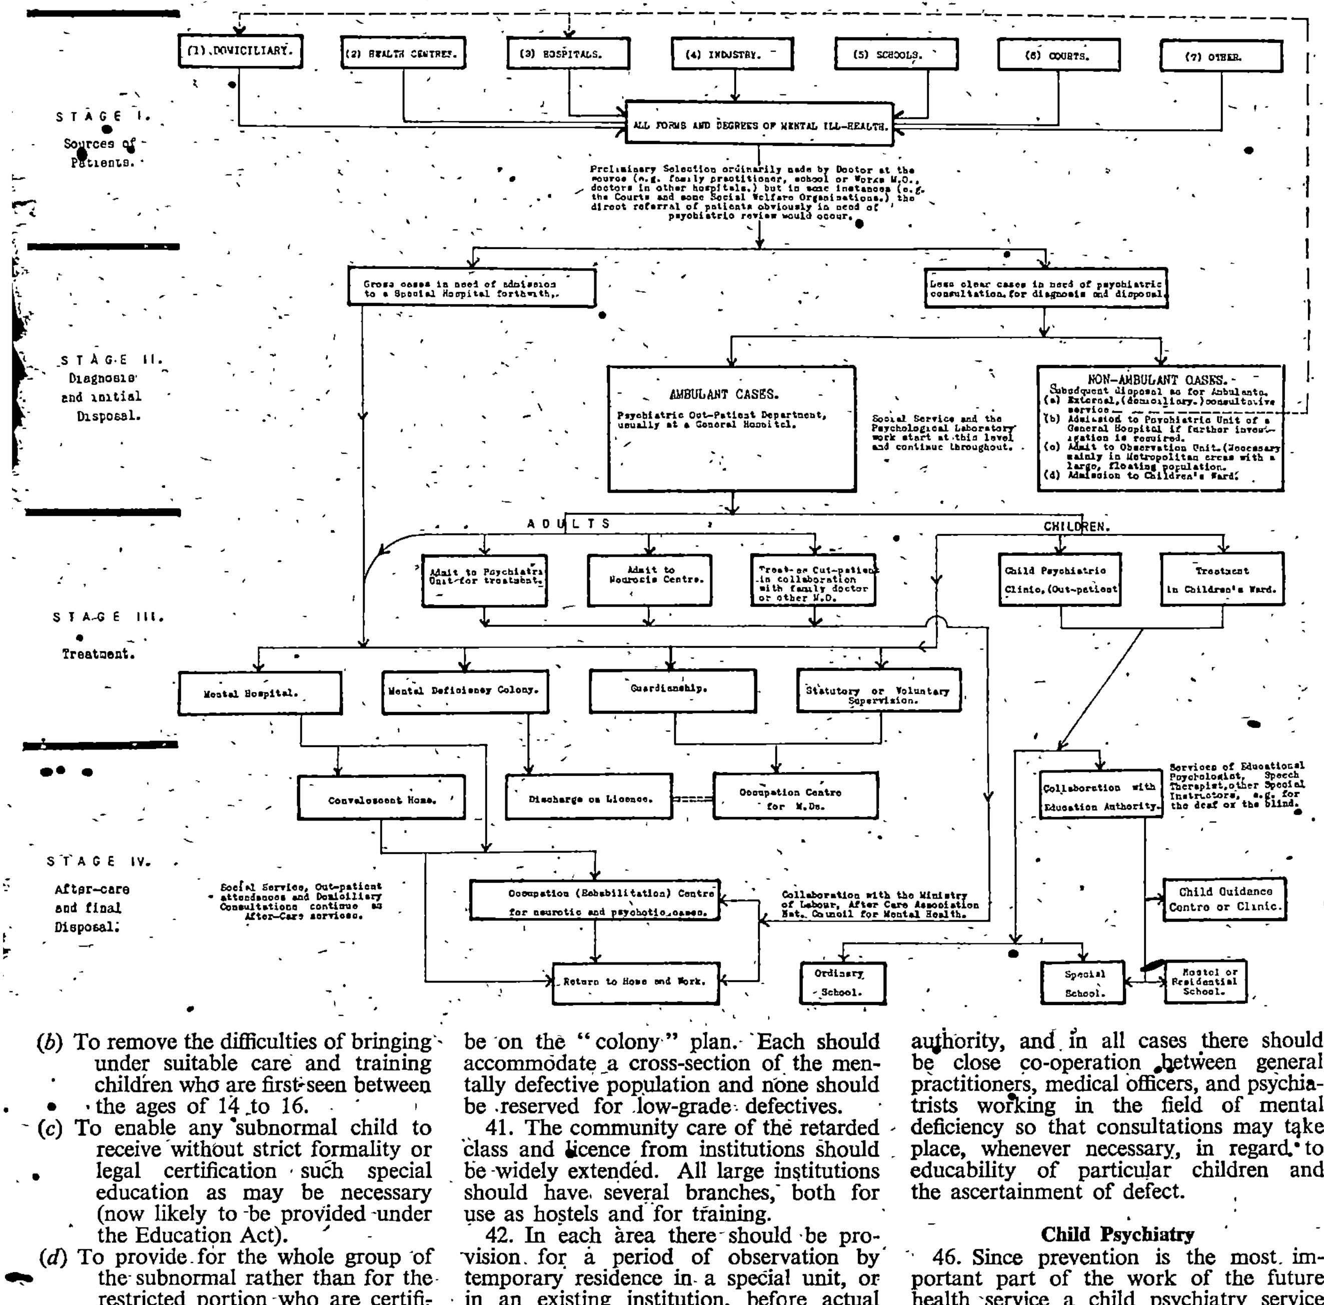
Mental Subnormality, including Mental Deficiency

35. It should be recognized that mental subnormality and its social consequences undoubtedly provide a very wide problem.

36. The present legal and administrative procedures need revision:

(a) To remove the existing confusion and anomalies whereby defective children are dealt with in several different ways under four different authorities.

A CO-ORDINATED MENTAL HEALTH SERVICE



(1) DOMICILIARY.
(2) HEALTH CENTRES.
(3) HOSPITALS.
(4) INDUSTRY.
(5) SCHOOLS.
(6) COURTS.
(7) OTHER.
STAGE I.
Sources of Patients.
ALL FORMS AND DEGREES OF MENTAL ILL-HEALTH.
Preliminary Selection ordinarily made by Doctor at the source (e.g. family practitioner, school or Works M.O., doctors in other hospitals,) but in some instances (e.g. the Courts and some Social Welfare Organisations,) the direct referral of patients obviously in need of psychiatric review would occur.
Gross cases in need of admission to a Special Hospital forthwith.
Less clear cases in need of psychiatric consultation for diagnosis and disposal.
STAGE II.
Diagnosis and initial Disposal.
AMBULANT CASES.
Psychiatric Out-Patient Department, usually at a General Hospital.
Social Service and the Psychological Laboratory work start at this level and continue throughout.
NON-AMBULANT CASES.
Subsequent disposal as for Ambulants.
(a) External, (domiciliary.) consultative service
(b) Admission to Psychiatric Unit of a General Hospital if further investigation is required.
(c) Admit to Observation Unit. (Necessary mainly in Metropolitan areas with a large, floating population.
(d) Admission to Children's Ward.
ADULTS
CHILDREN.
Admit to Psychiatric Unit for treatment.
Admit to Neurosis Centre.
Treat as Out-patient in collaboration with family doctor or other M.O.
Child Psychiatric Clinic, (Out-patient
Treatment in Children's Ward.
STAGE III.
Treatment.
Mental Hospital.
Mental Deficiency Colony.
Guardianship.
Statutory or Voluntary Supervision.
Convalescent Home.
Discharge on Licence.
Occupation Centre for M.Ds.
Collaboration with Education Authority.
Services of Educational Psychologist, Speech Therapist, other Special Instructors, e.g. for the deaf or the blind.
STAGE IV.
After-care and final Disposal.
Social Service, Out-patient attendances and Domiciliary Consultations continue as After-Care services.
Occupation (Rehabilitation) Centre for neurotic and psychotic cases.
Collaboration with the Ministry of Labour, After Care Association Nat. Council for Mental Health.
Child Guidance Centre or Clinic.
Return to Home and Work.
Ordinary School.
Special School.
Hostel or Residential School.

(b) To remove the difficulties of bringing under suitable care and training children who are first seen between the ages of 14 to 16.

(c) To enable any subnormal child to receive without strict formality or legal certification such special education as may be necessary (now likely to be provided under the Education Act).

(d) To provide for the whole group of the subnormal rather than for the restricted portion who are certifiably defective.

(e) To provide that a certified institution may, when advisable, admit patients on a "voluntary" basis on the application of a relative and one medical recommendation as in Section 1 of the Mental Treatment Act, 1930, and also in conformity with Section 5 of this Act on a temporary basis.

37. The medical adviser to the mental health authority, if not sufficiently experienced in mental subnormality, should be advised by a recognized specialist in this field.

38. The entire service of the subnormal should be transferred from the public assistance authorities to the mental-health authority.

39. For the retarded group an increased number of special schools, both residential and day, is required. More occupation centres should be established.

40. Mental deficiency institutions should be on the "colony" plan. Each should accommodate a cross-section of the mentally defective population and none should be reserved for low-grade defectives.

41. The community care of the retarded class and licence from institutions should be widely extended. All large institutions should have several branches, both for use as hostels and for training.

42. In each area there should be provision for a period of observation by temporary residence in a special unit, or in an existing institution, before actual certification in the case of a high-grade defective. Admission to such units should be on a "voluntary" basis in the case of minors or on the order of a magistrate or other official approved for the purpose by the department of mental health, and should be for a period not exceeding six months. Special experience and qualifications should be possessed by at least one of the practitioners who certifies the fact of mental deficiency in any case.

43. All doctors employed in mental deficiency colonies or institutions should have opportunities for extra-mural duties in order to provide the essential specialist advice in schools, clinics, and hospitals, and to maintain and promote their own general efficiency by a wider range of medical practice.

44. The ascertainment of mental deficiency should be entrusted to psychiatrists with appropriate experience.

45. It is desirable that a psychiatrist should be appointed to every education authority, and in all cases there should be close co-operation between general practitioners, medical officers, and psychiatrists working in the field of mental deficiency so that consultations may take place, whenever necessary, in regard to educability of particular children and the ascertainment of defect.

Child Psychiatry

46. Since prevention is the most important part of the work of the future health service a child psychiatry service must be an integral part of any adequate mental health services. Child guidance clinics with associated in-patient facilities are required in every area, and should be under the management of the mental health committee working in close co-operation with the education authorities.

47. As an important prophylactic measure there should be systematic psychological examination of every school child. These examinations should be primarily the function of the educational psychologist, but all cases showing emotional instability or serious intellectual subnormality should be referred for full psychiatric examination.

48. Residential school treatment under psychiatric direction should be made

available for maladjusted children, preferably by "voluntary" admission.

Delinquency

49. Psychiatric advice should be made more widely available to the courts so that greater use of it could be made by them. There should be collaboration with the legal authorities at all stages in the ascertainment, treatment, and rehabilitation of offenders.

50. A mental health service should cover at least the psychiatric requirements envisaged in the Criminal Justice Bill of 1939, and the powers of the central health authority should include at least the provision of psychiatric advice to approved schools, Borstal institutions, remand homes, and the special hospitals proposed in the Criminal Justice Bill.

51. In-patient facilities, of the "colony" and hostel types, are urgently needed for delinquents, and out-patient facilities require expansion in all parts of the country.

GENERAL MEDICAL COUNCIL

DISCIPLINARY INQUIRIES

Improper Conduct with Patients

The Council on May 31 and June 1 and 2 considered the case of Arthur Henry Hennessy, registered as of Limpsfield Road, Sanderstead, who was summoned on the charge that being a registered medical practitioner, and standing in professional relationship to a certain lady who was described as Miss A. B., he on Sept. 26 last attempted to commit adultery with her, indecently assaulted her, and assaulted, or was party to an assault upon, her. The complainant was Miss A. B., who was represented by Mr. H. Heathcote-Williams. Mr. Oswald Hempson appeared for the respondent on behalf of the Medical Defence Union. Mr. Heathcote-Williams, having regard to the nature of the evidence in this case, asked that it be heard *in camera*, and Mr. Hempson raising no objection, strangers were required to withdraw.

After a hearing which extended in all over eleven hours, the decision of the Council was announced in public by the President as follows:

> Mr. Hennessy, I have to announce that the Council have found that the facts alleged against you have been proved to their satisfaction. In respect of the facts so proved, the Council have judged you to have been guilty of infamous conduct in a professional respect, and have instructed the Registrar to erase from the *Register* the name of Arthur Henry Hennessy.

The Council considered the case of Alfred Herbert Bartley, registered as of Woodbourne Avenue, Streatham, S.W., who appeared on the charge that, standing in professional relationship to a married woman, her husband, and her cousin, he between February, 1944, and March, 1945, behaved improperly to her, that between the same dates he frequently committed adultery with her, and that having undertaken to the husband to cease seeing or having any contact with her, he continued secretly and in breach of such undertaking to meet and improperly to associate with her.

Dr. Bartley appeared and was represented by Mr. Geoffrey Howard, counsel, instructed by W. R. Bennett and Co. The complainant, the husband, was represented by Mr. H. Heathcote-Williams, instructed by Waterhouse and Co. For the purpose of the proceedings the complainant was referred to as Mr. A. B.

Mr. Heathcote-Williams, in outlining the case, said that on Feb. 7, 1944, Mrs. A. B. telephoned a doctor concerning a cousin of hers who was ill, and to her surprise the telephone was answered, not by the expected doctor on whose insurance list her cousin had placed herself, but by Dr. Bartley, who said that the practice was his. It was arranged that Mrs. A. B. should see him on the following day, and it appeared that he was immediately attracted by her. During the next fortnight he telephoned about six times, asking her to call at the surgery, but when she did so he made only slight remarks about the case of her cousin and talked about general matters. On Feb. 21, when she again visited the surgery, he, after some short conversation, kissed her, made love to her, and committed adultery with her. Thereafter an association developed, entailing secret meetings, and adultery at hotels, at Dr. Bartley's house, and at various other places, including Battersea Park and Wimbledon Common in the doctor's car at night. Love letters from the doctor were also read, one of them containing the sentence, "I shall be alone from the 16th to the 19th." In August the husband became suspicious, and his wife admitted that there was another man, and later that the man was Dr. Bartley. He interviewed Dr. Bartley, who admitted being in love with his wife, and agreed to terminate the association, but in spite of this and later undertakings, he continued to commit adultery. In November, 1944, Mrs. A. B. started a course of treatment with Dr. Bartley for loss of weight, and on each occasion on which she had the treatment—an electrical treatment—adultery, it was alleged, took place.

Mr. Howard, on behalf of the doctor, said that it would shorten the case and cut out the necessity for much unpleasant evidence if he at once admitted the adultery; but he contested the professional relationship.

The President: If the adultery is admitted —we are not a court of morals—the question before the Council is solely the professional relationship.

Mrs. A. B. then went into the box and confirmed the story which had been related by counsel. She said that the first occasion when she herself was treated by Dr. Bartley was in July, 1944, when she had a rash; he gave her three bottles of an arsenic mixture, and also a cream which he made up. She admitted that she had been in love with him, but her feelings had entirely changed since she found him to be a man without any scruples. She could no longer care for a man whom she could not respect.

Dr. Bartley, in evidence, said that acts of adultery took place, beginning in February, 1944, and continuing until February, 1945, when the relationship ceased. At the time when this association began he did not stand in any professional relationship with Mrs. A. B., nor were any of these acts brought about by any abuse on his part of his professional position. About nine months after the intimacy began Mrs. A. B. asked for his professional help on account of underweight, and he prescribed certain treatment for her. There were six of these professional visits, which ceased within a month. He produced his attendance cards relating to this treatment. In cross-examination, he agreed that the lady was his patient—"If I treat a friend, I suppose, I being a doctor, she becomes my patient." Pressed on the point that he had not honoured the undertaking he had given to the husband, he said that he was thoroughly ashamed of the episode, but in his view it had no bearing on the question of professional conduct.

Are you suggesting that Mr. A. B. threw you together in order that you should continue the adulterous association?—That is a matter of opinion.

Is it your opinion?—It is my opinion.

This reply led cross-examining counsel to read a letter which Dr. Bartley had written to Mr. A. B. on April 14 last in which he referred to his (Mr. A. B.'s) generosity in the past, and his regret that what was a last-chance meeting with the lady should have been regarded by the husband as a breach of the undertaking.

After further evidence and speeches by counsel, the Council deliberated *in camera* and later the President announced that th Council had found the facts to have bee proved, and in relation to those facts ha judged Dr. Bartley to have been guilty o infamous conduct in a professional respec and had instructed the Registrar to erase h name from the *Register*.

Convictions

The Council considered the case of Za Risk, registered as of Sheldon, Birmingha who, at Birmingham assizes in Decemb 1944, had been convicted, in the case of women, of having caused to be take poison or other noxious thing, with in to procure miscarriage; also of supplyin poison or noxious thing knowing that it intended to be unlawfully used with int to procure miscarriage in the case of anoth woman, and of unlawfully inciting anoth person to supply a poison or noxious thi to this same woman knowing that it w intended to be unlawfully used with inte to procure miscarriage. On each of th counts he had been sentenced to be imprisoned for two years, the sentences to run concurrently.

The respondent went into the witness-box and denied that he had at any time administered this poison with intent to procure abortion. The Legal Assessor reminded him and other respondents who came up in consequence of convictions that the Counci was not a court of appeal, and that it mus accept the conviction, while prepared to listen to anything which might be said in extenuation on the respondents' behalf. Asked why he had accepted sums of £20, £8, and £5 in these cases, he said that the were more than ordinary consultations.

It was mentioned that the respondent h done excellent work in Birmingham in formation of a detachment of the Red Cro

The Council, after private deliberatio found the conviction proved, and instructe the Registrar to erase the name.

The next case was that of Mohammed Farid, registered as of Acock's Green, Birmingham, who appeared on the charge that at Birmingham Assizes in December last he had been convicted of unlawfully killing one of the women mentioned in the case of Dr. Risk reported above. He had been sentenced to four years' penal servitude, which sentence was affirmed on appeal.

Dr. Farid said that he did not intend to take up the time of the Council in contesting the conviction, but he felt that he had not had a fair trial.

The Council in this case also instructed the Registrar to erase the name.

The next case was that of John Nei Leitch, registered as of Crescent Wood Road, Sydenham Hill, London, who was summoned on the charge that at the Central Criminal Court in January, 1945, he was convicted of certain misdemeanours—namely, with intent to defraud, of attempting to obtain a sum of £99 from the War Damage Commission by false pretences, and of obtaining £50 from the Commission by false pretences, also of obtaining credit to the extent of £33 from one person and £63 from another without disclosing the fact that he was an undischarged bankrupt.

The Council instructed the Registrar to erase the name.

The case was also considered of Annie McCrorie, registered as of Queen's Drive, Crosshill, Glasgow, against whom there were wo convictions of driving and being in charge of a motor-car while under the influence of drink to such an extent as to be incapable of having proper control of the car. One of the convictions, both of which were at the Sheriff Court of Lanarkshire, dated from July, 1941, and the other from ecember, 1944. It was stated on behalf of Dr. McCrorie that she was almost a totaller, and that a small amount of cohol upset her unduly.

The President said that the Council found e convictions proved, but would not pro- ed to judgment upon them. No doubt at had happened would be a sufficient rning.

Adjourned Case

The Council further considered the case James Kirkness, registered as of Warren- Park Crescent, Edinburgh, against whom Council in May, 1944, had found cer- facts proved—namely, that on an sion in November or December, 1942, had been so far under the influence of k as to be incapable of properly carry- out his professional duties towards ients who were waiting to consult him his surgery.

Dr. Kirkness now appeared and produced timonials as to his conduct in the inter- l. The Council did not see fit to proceed erasure.

Fraudulent Entry

The President announced that the Council had found that an entry in the *Medical Register* on Oct. 4, 1943, in respect of Mrs. Doreen Warren, M.D.Berlin, had been proved to its satisfaction to have been fraudulently made. In pursuance of the Act of 1858 the Council had directed the Registrar by order in writing to erase from the *Medical Register* the entry in question.

The Council's session lasted for five days, during a large proportion of which time it sat in private. Several cases were postponed.

EARD AT HEADQUARTERS

International Relations

The B.M.A. has made many friends during the war with members of the medical profession from other countries who have served with the Allied Forces, or have worked here with their Governments in exile during the German occupation of their countries, or have helped to relieve the heavy burden on British doctors in civilian practice. It would be a pity not to continue into peacetime the friendly relations that have been formed under the stress of war. A report of an informal conference on the subject appeared in the *Journal* of Dec. 2, 1944.

On June 6 a further conference, under ne chairmanship of Dr. J. C. Matthews, Chairman of the Association's International Relations Committee, was held to discuss the practical problems involved in the establishment of organized international medical relationships, if such were considered desirable, in the field of what are known in this country as medical politics. There were present doctors from Belgium, the Netherlands, Poland, U.S.A., and Yugoslavia, who have been in Great Britain during the war; Dr. Decourt, Secretary of the Association Professionnelle Internationale des Médecins (A.P.I.M.), and Dr. Cibrie, Secretary of the Confédération des Syndicats Médicaux, who came from Paris specially for the conference; and a representative of the International Labour Office; as well as members of the Association's International Relations Committee.

The French representatives were apprehensive lest the proposals to be made should destroy the A.P.I.M., which had been in existence since 1925 and which they insisted was still alive and had been suspended only during the war. Other speakers thought that an international organization which did not include the U.S.A. or Russia could not be truly international. The Netherlands representative hoped that, as the national organizations in the liberated countries re-established themselves, they would be afforded an opportunity of learning what the other national organizations were thinking and doing. He thought that the only country which was in a position to undertake the collection and dissemination of information was Great Britain, and all countries would certainly want to know of the B.M.A.'s experiences during the war and its activities in connexion with the National Health Service.

After an interesting discussion the conference passed a resolution to the effect that, although it could not speak officially for national medical organizations, it believed that an international organization of national medical organizations was desirable. It was decided that a conference of national medical organizations should be held in London during the early months of 1946. The B.M.A. will co-operate with the A.P.I.M. in the preparation of the agenda. It is hoped that by that time the national medical organizations in Europe will be able to take part.

The Medical Students at Belsen

Everywhere praise is being given to the hundred or so British medical students who at the end of April went from London to work in the Belsen horror camp. The results of their energy and drive were manifest at once in the fall of the death rate in one week to half of what it had been the week before, and in the following week to half of that again. Twice within a few days, once at an inter-allied medical conference at the Royal Society of Medicine, and again at a meeting held under the auspices of U.N.R.R.A., high commendation was given for the cheerfulness and initiative and enthusiasm of these students in the presence of tragedy and horror and filth and stench. Dr. A. P. Meiklejohn, to whom was assigned the task of supervising the work of the students, declared that in a similar desperate situation he would care for nothing better than to have the help of medical students, and that he was convinced that no other body of men could possibly have carried out this difficult job.

Overworked G.M.C.

It looks as if there will have to be four sessions of the General Medical Council in a year. For many years there were two sessions, one in May and one in November, each lasting for about a week. In the last year or two so many cases had to be left over from the November sessions that it was necessary to hold a special one in February, and this year, at the May session just concluded, several cases had to be postponed, and it seems likely that yet another extra session will have to be held.

Has the G.M.C. ever considered the practice followed by assizes and quarter sessions in the presence of a heavy calendar of splitting into two courts sitting simultaneously? It is true that this would necessitate the appointment of a deputy president and of a deputy legal assessor, but the economy in money, not to speak of time, would more than justify the course. Is there any legal tribunal in which as many as forty members, all of them occupying important positions, are called upon to listen day after day to petty evidence concerning alleged misdoings of particular persons? Surely a much smaller tribunal could deal with the situation with equal justice to all the parties. After all, it requires no more than twelve people to try a man on a capital charge, and no more than seven to try cases of the type which ordinarily occupy the G.M.C.

Homoeopathy and the Association

The Organization Committee of the B.M.A. is recommending the Council that no case has been made out for a separate Group of Homoeopathy in the Association. This is the answer to a petition signed by 87 members of the Association who are engaged in the study and practice of homoeopathy. The committee was led to its decision by a memorandum by the Secretary, of the B.M.A., which, it is to be hoped, will be communicated to the Faculty of Homoeopathy as well as to the members interested, in order to show on what grounds the recommendation has been based.

The whole matter is innocent of any prejudice against homoeopathy as such. Indeed, the proposed refusal is not on the ground that homoeopathists are in any sense separate from the rest of the profession, but, on the contrary, that they are so much a part of it that they cannot be said to have distinctive professional interests. One of the arguments of the petitioners was that in any one Division of the Association the number of homoeopathists would be so small that they could not adequately present their problems, but in answer to this it is pointed out in the memorandum that the Divisional work of the Association is mainly professional and medico-political, not scientific in character, and that it is only in the scientific field that homoeopathy begins to diverge from the rest of the profession.

With great care and courtesy the memorandum advances the view that homoeopathy cannot properly be called a specialty in the usual meaning of the term, as it is applied, for example, to practitioners of physical medicine or of psychological medicine, who already have their Groups. Homoeopathy is not so much a specialty as a general system of medicine running parallel to the system adopted by the majority. There is no criticism of homoeopathy; it is simply a question of the logic of the situation.

Cost of Treatment of School-children

It is estimated by the L.C.C. that the cost of the medical treatment of school-children in its county hospitals will be at least £600,000 a year. This is apart from the cost of cases of infectious disease, for which free hospital treatment has always been available. From April 1 last, by the provisions of the new Education Act, the pupils attending schools assisted by the council at which no tuition fees are charged, or pupils in respect of whom the council pays the whole or part of the fee, are receiving free medical and dental treatment at the school treatment centres and at the council hospitals. It is stated that the general position of the treatment of children at the London voluntary hospitals is under consideration, and negotiations are proceeding.

Correspondence

Organization of Psychiatric Services

SIR,—We learn from the *Supplement* of May 19 (p. 93) that a report on the future organization of the psychiatric services has been prepared which does not take into consideration the views of Service psychiatrists. Such a report can scarcely remain unchallenged. Is the country not to benefit by the new views of Service psychiatrists who, if asked, would willingly discuss various aspects of their work in the Forces which they consider could be applied to civil life to the advantage of the community?

Several branches of medicine and surgery have benefited and will benefit in civil life as a result of the experiences and findings of its Service personnel. Is this not to apply in the case of our own specialty? Psychiatry was in its infancy before the war. It is now on a firmer and broader footing, especially in the Forces, and I very much doubt whether all psychiatrists who have been carrying on in civil practice for the past five years realize the greatly increased range of activities of their colleagues in the Services.

Obviously, the majority of us in the Forces are the younger psychiatrists, and it is we who will be taking an active part in the future civil organization. We undoubtedly have many new views, and it is only right that an opportunity should be given to us to express them. What steps have been taken so far by the committees who approved of this report to ascertain the views of Service psychiatrists? If we have been represented on the committees or any of them, has that representation been adequate? From Dr. Gordon's remarks it would seem that the answers to these questions will not be satisfactory.

Those of us in the United Kingdom are in a position to speak for our colleagues over-seas who have even less chance of knowing what is happening in the homeland, and we fail in our duty to them if we allow new views of a younger generation of medical men to be ignored. As a first step I suggest that a copy of this report be sent to every Service psychiatrist whether at home or over-seas, and with it a questionary; that no plans should be put forward until there has been time for the new views to be submitted; and that there should be immediate and reasonably proportionate representation of the Service psychiatrists on the committees concerned. Only thus can the population be assured that it is to benefit to the fullest by all the experience and knowledge of civilian and Service psychiatrists during the war.—I am, etc.,

Sutton, Surrey. J. ALAN HERD, Major, R.A.M.C.

Medical Demobilization

SIR,—In the last few issues of the *Journal* there have been many controversial letters about the Army Services and the E.M.S. I well realize that most R.A.M.C. officers are very eager to get out of the Army and return to civil life, for no one has greater desire to do that than I. The disappointment is that the medical authorities allow this differentiation between one Service and another. The work done in the Army does not differ ideologically from that in the E.M.S. in a medical sense. Of a certainty there are advantages and disadvantages in both, but that one essential service to the country should have any advantage over another is beyond comprehension and is not just. Without an E.M.S. it would have been necessary to put many hundreds more doctors into the Army; instead these M.O.s served in the E.M.S. doing no more or no less than the doctor serving in a military hospital, but at a lower remuneration. During my own service in the E.M.S.—two years and one month —I looked after none but Service cases. This controversy would not have arisen if the authorities had mobilized medical man-power on an equal standard and not forced doctors already called to the Army into the E.M.S. in 1940.

The hardest part of Army life is being over-seas, not seeing wife or children for years. Medical knowledge and experience can be made up later, but every day that passes without one's family has gone for ever. Service in the Army and the E.M.S. must count equal for release; but the main duty of the authorities is to see that oversea service is cut to an absolute minimum. Men in the British Army, medical and otherwise, have had to serve over-seas much too long; it is now time this was rectified and the wives and children were considered.—I am, etc.,

C.M.F. B. O. PORCHETTA.

SIR,—In view of the increasing number of applications being received for the release of medical practitioners from the Services by the various Local Medical War Committees, my committee think that a definite number of doctors should be requested from the Services by the Central Medical War Committee, and that in the same way as local committees were asked for a quota of their practitioners for Service requirements, so a quota might now be given to those committees to enable them to get back to their areas the doctors who in their opinion should be the first to return. The local committees would bear in mind the various reasons for such return—as, for example, the inability of older practitioners to carry on for another winter without more assistance, or the grounds of hardship on the part of doctors who have been in the Services for a considerable time. Also, the claims of older men in civilian practice should be taken into consideration so that not only military and civilian needs should be considered but also the actual needs of the doctors themselves, with particular reference to the older men. While there was a double war on, many of these older doctors were prepared to do far more than a day's work, but now that the war in Europe is over it does not seem fair to press them to do so much in the future. Moreover, the civilian population might now be given a better deal as regards their medical needs. The Local Medical War Committees would be in a better position than anyone else to judge of the needs of their particular districts.—I am, etc.,

Harrow Local Medical War Committee. N. P. JEWELL, Hon. Secretary.

*** We are informed that when re-allocation begins on June 18 the Central Medical War Committee will consider applications for release in Class B on the ground of urgent civil need, but in the view of the committee such releases must be kept at a bare minimum so as not to impede the release of practitioners in Class A on the age and length of service formula. Such releases, which will shortly start, will themselves begin to ease the burden of civilian doctors. Release on compassionate grounds cannot be considered by the committee, but will continue to be granted in suitable cases on the application of the individual officer through Service channels.—ED., *B.M.J.*

Medical Demobilization and Resettlement

SIR,—Security is the catchword of the moment. The *Supplement* has been filled with letters of varying degrees of acrimony, a leading article in the *Lancet* has advocated interchange between doctors in civil life and those now in the fighting Services, and eloquent pleas are made that there shall be no division in our ranks over the merits or demerits of our professional lives since 1939.

Insecurity, however, looms large in the outlook of the serving doctor; most have lost clinical experience to a greater degree than ourselves, but many have also lost their practices. These latter are anxious to know what prospect awaits them on their return to civil life. Do they polish their plates and face (with two months' pay and a pitiful gratuity) the uphill rebuilding of a living where once they had a flourishing practice? Do they feel that immediate re-establishment and a reasonable outlook await them? Is a State medical service to follow immediately on demobilization or is it not?

At a recent meeting of the Division in which we are stationed we were heartened by the unanimous approval given by our civilian colleagues to a resolution deploring the lack of any scheme of rehabilitation sponsored by the B.M.A. Since that time a scheme of clinical rehabilitation has been published; it falls woefully short of any suggestion as to how men who once had established practices are to live during their rebuilding years, or how they are to save something from the "wreck."

The Central Medical War Committee's recent circular to serving medical officers puts all the questions which we have been asking for a year or more; unfortunately it supplies few of the answers. What is more, this letter throws grave doubt upon the assurance given in the *Supplement* of March 17, 1945, that the group releases of doctors would receive neither more nor less than just treatment in accordance with the provisions of the Government's White Paper. Service doctors do not wish prior treatment in the matter of demobilization, but their resentment will be intense if their personal group release passes them by.

The C.M.W.C. obviously does not know the remedies, or it would not ask for suggestions. Let the B.M.A. give a lead to our colleagues in civil life telling them how essential it is for them, in their Divisional areas and by every means in their power, to assist the returning men to regain their practices. Let the B.M.A. indicate that anyone who has contravened the spirit or the letter of the Protection of Practices Scheme is unwelcome as a member of the B.M.A., or would the defection be too great for even the B.M.A. to stand? Above all, let the C.M.W.C. press on the Government the recruitment of sufficient medical men, even up to the age of 50 or more, to ensure release in our groups. Let us have assurance on all these points, so that we may have some idea of how to manage our civil commitments.

These problems are now more urgent to us than that of a State medical service; secure us in these and whether we wore uniform or not will soon be forgotten.—We are, etc.,

The Entire Medical Staff of an R.A.F. Hospital.

*** The Secretary of the C.M.W.C. writes:

(1) The Central Medical War Committee has endeavoured in its circular not only to state the questions which are known to be in the minds of Service doctors but to state the answers. It invites suggestions in order that no opportunity for helping Service doctors shall be missed. *The committee is doing and will do all in its power to secure the release of doctors upon the age and length of service formula.* It is being supplied by the Service Departments with the names of those who fall to be released in their order, and it will proceed with any necessary recruitment for replacement to the extent to which it is necessary. Class B releases on the ground of civilian need will be kept at a bare minimum. Release, group by group, at the highest possible rate is its objective.

(2) There will soon be issued a memorandum of advice to Divisions of the B.M.A. on the help civilian doctors should afford to returning practitioners in the re-establishment of their practices. Issues raised by the Protection of Practices Schemes will be frankly dealt with.

(3) Recruitment of doctors will continue until further notice up to an age yet to be decided by the Government.

(4) I can assure these R.A.F. medical officers that the men in uniform are not being forgotten.

* * *

Medicine in India

SIR,—Dr. M. N. Pai, writing in the *Supplement* of June 2 (p. 100) on the medical and sanitary situation in India, although justly impatient at the slow rate of progress, makes so many sweeping statements of an erroneous kind that it is in the public interest to point them out.

He speaks disparagingly of the standard of teaching, of "professors who have no higher qualification than the medical degree of an Indian University, and do not even possess the D.T.M.," and doubts whether there are a thousand microscopes in the whole of India. The truth is that the university standards of medical education (as apart from those of certain licensing bodies) are as high as anywhere else, the teaching hospitals are staffed almost everywhere by Indians and Englishmen possessing either higher qualifications or exceptional experience (for which latter, compared to diplomas, your correspondent apparently finds no use), and that in view of the extreme popularity of biology courses at the universities and the advanced course in bacteriology *normally* included in the Indian curriculum, he will find a thousand microscopes at many Indian universities. I suggest, for example, that he visits the Punjab University at Lahore, where he will find such extensive and nobly built laboratories, so much scientific equipment, and so many microscopes as to rival any institution abroad. There are, besides, well-known research institutes at Bombay and Calcutta and other university towns, and the number of medical schools in India is assuredly not so small as "hardly worth mentioning."

The absence of a D.T.M. and D.P.H. is not such a serious matter for Indian practitioners because the ordinary bacteriology course is so arranged as to include all that is needed. When Dr. Pai implies that scientific medicine is only being practised by "a small band of missionary doctors" he is less than fair to the large body of university-trained private practitioners in all the Indian towns who have extensive practices, and many of whom are men of great experience, skill, and humanity without being "missionaries." They practise unobtrusively, and invariably their clientele is irrespective of any religious bias. Such evils as advertising are bound to crop up on occasions in any country, and the only remedy is some legally constituted Indian body, such as the General Medical Council here. Proposals for such a body have already in recent years been discussed by the Indian Government.

I come to the main grievance of Dr. Pai—namely, the "indigenous system of medicine": i.e., Ayurvedic and Unani. He is wrong in writing the latter as synonymous with Arabic as it really stands for Greek, from *Ionian*, and the Sanskrit for Greek, *yavana*. It is true that these systems are in the modern world quite out of date and inadequate, but in a country like India where there is much poverty, and where there are vast rural areas without doctors, one must be a little circumspect before dubbing all practitioners of such systems as "charlatans," "quacks," and "magicians." Let us reflect for a moment on the historical fact that modern medicine in Europe is based on Arab medicine as introduced in Southern Europe, and that Arab medicine was itself based on Greek and Indian medicine as studied and synthesized at Baghdad. The therapeutics of the "indigenous systems," as investigated by many able doctors, are still perfectly sound within their limited scope, and for many everyday and minor ailments of poor people afford great relief and even excellent cures. Provided ultimately the aim is to modernize these systems and to bring all medical education to the same high level, there is no harm in making a register of the genuine old-style physicians so as to control their activities in the interim period, and, indeed, during the inevitable phase of short medical personnel, to use them as auxiliaries. Another virtue of such registration is that the real "charlatans," etc., can be excluded.

Many of these earlier physicians were, according to the standards of their times, skilful clinicians and honourable men, and always gave a high place in their studies to diagnosis. Nowadays, faced with any difficult case, they gladly refer them to the nearest doctor or hospital. In cases where it was a family profession their children to-day, as a matter of course, go to the university medical schools.—I am, etc.,

RASHEED AHMAD, M.R.C.S., L.R.C.P.

Dagenham, Essex.

Time for a Change

SIR,—To surgeons serving in Italy, Mr. T. B. Layton's letter (*Supplement*, March 24, p. 44) was encouraging as a reminder that a few at least of our civilian colleagues appreciate the conditions under which we have worked, and his remarks about an exchange system sounded admirable to our ears, especially those of us who have been separated from wives and families for upwards of 3 years. It seemed to us only fair that, having done our share of oversea service, we should be replaced by colleagues from the E.M.S.

Dr. Clifford Parsons's letter (*Supplement*, April 21, p. 63) in answer to that of Mr. Layton's, contains the usual misconceptions about the Services held by those who have been in many ways more fortunate than us over-seas. I feel sure he writes with his tongue in his cheek when he states his post cannot be relinquished until a successor has been trained. For how long has this startling procedure been the custom in England? Does a house-surgeon, an R.S.O., a registrar, an honorary surgeon, or the occupant of a professional chair now retain his job for 3 months longer while he trains a successor? If this is so our rehabilitation to civilian medicine will most certainly be delightful if we are to be groomed for our jobs. Three months is a long time, and I think Dr. Parsons would find if he did decide to join the R.A.M.C. that he would be "pulling his full weight" to the R.A.M.C.'s satisfaction, if not to his own, in a very much shorter period. After all, the initial training course for R.A.M.C. officers is 2 to 3 weeks, and after that the R.A.M.C. officer may find himself on board ship bound for Burma or Italy in a shorter period than 3 months. Many M.O.s found themselves in France in '39 a fortnight after joining the Army. In North Africa I worked with men who found themselves on an invasion force 1 to 2 months after joining the Army.

Mr. Layton's letter cheered us up immensely, but seeing a letter like that of Dr. Parsons soon after we have been informed here that only 6% of the C.M.F. Forces are likely to be demobilized by the end of this year (*re* release groups 1–17) has done nothing to dispel our increasing gloom at the prospect of another 1 to 1½ years abroad.—I am, etc.,

C.M.F. "F.S.U. SURGEON."

An Absent Doctor Asks

SIR,—I have read with interest the correspondence in the *Supplement* dealing with demobilization problems of doctors. I venture, however, to raise two points which I have not seen referred to; and would like to know whether the B.M.A. or the Central Medical War Committee has any views or policy regarding them.

First, is there any protection for an absentee doctor against squatting in his area by another doctor? This is particularly important for those doctors who are likely to be released late and who ran single-handed practices. As you are no doubt aware, most tradesmen are protected from this type of competition.

Secondly, I note that the Central Medical War Committee is negotiating with the Government as to ways and means by which young doctors released from the Services may be enabled to purchase practices without involving themselves in unduly heavy commitments. I entirely agree with such action, but is any assistance contemplated for those doctors who purchased their practices before the war, who have been unable to reduce their commitments—in some cases have found these increased—whilst on Service, and who now contemplate the return to an almost non-existent practice to which they are tied financially, and payment for which must be completed before any change can take place?—I am, etc.,

SERVING MEDICAL OFFICER.

H.M. Forces Appointments

ARMY

War Subs. Major J. C. Hawksley, R.A.M.C., to be a Consultant, and has been granted the local rank of Brig.

ROYAL ARMY MEDICAL CORPS

Short Service Commission.—War Subs. Major L. E. C. Davies, M.B.E., to be a Consultant, and has been granted the local rank of Brig.

Lieut.-Col. W. D. Newland, M.C., having attained the age for retirement, is retained on the active list supernumerary.

Major (War Subs. Lieut.-Col.) J. W. Eames to be Lieut.-Col.

Capt. J. P. Weir to be Major.

Short Service Commission.—P. A. T. Wood to be Lieut.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major F. C. Atkinson-Fleming, M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

TERRITORIAL ARMY

Col. D. Dougal, M.C., T.D., late R.A.M.C., having attained the age limit, has retired, retaining the rank of Col.

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. J. B. Scott, M.C., T.D., having attained the age limit, has retired, retaining the rank of Lieut.-Col.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. J. W. E. Ord has relinquished his commission on account of disability, and has been granted the honorary rank of Major.

War Subs. Capts. A. Anderson and G. H. Pickering have relinquished their commissions on account of disability and have been granted the honorary rank of Capt.

J. Tillman to be Lieut.

WOMEN'S FORCES

EMPLOYED WITH THE R.A.M.C.

War Subs. Capt. (Mrs.) E. J. McBryde has relinquished her commission.

War Subs. Capt. (Miss) E. J. B. Orr has resigned her commission.

ROYAL AIR FORCE

Flying Officer S. C. Farman to be War Subs. Fl. Lieut.

ROYAL AIR FORCE VOLUNTEER RESERVE

Flying Officers H. B. Brown, M. S. Burke, R. H. C. Conynham, D. J. Gracie, J. J. O'Callaghan, D. E. Coyle, M. M. Garrey, and M. Sheridan to be War Subs. Fl. Lieuts.

To be Flying Officers (Emergency): R. W. Barter, B. N. Cook, B. V. Earle, W. A. Eggeling, G. W. Garland, F. G. Grant, R. K. Hay, D. T. Kay, M. S. Miller, W. A. Robson, and A. B. Sclare.

WOMEN'S FORCES

EMPLOYED WITH THE MEDICAL BRANCH OF THE R.A.F.

Fl. Lieut. R. Walford has resigned her commission.

INDIAN MEDICAL SERVICE

Major W. T. Taylor to be Lieut.-Col.

ARMY IN BURMA RESERVE OF OFFICERS

EMERGENCY COMMISSION

D. J. Lapping to be Lieut.

A circular from the Ministry of Health states that in the administration of National Health Insurance benefits certain insured persons are referred to divisional medical officers of the Ministry for independent medical examination; and it has become apparent that in some instances, as a result of this examination, it is advisable for the divisional medical officer, where a tuberculous condition is diagnosed or suspected, to refer the case, for specialist investigation and report, to the tuberculosis officer of the area in which the person concerned is entitled to the facilities of the tuberculosis service. It is not expected that such cases will be numerous in any one area, and it will be left to the tuberculosis officer to arrange the time and place of examination. The divisional medical officer will communicate the findings of the tuberculosis officer to the insurance practitioner concerned in the case.

BRITISH MEDICAL ASSOCIATION

ANNUAL GENERAL MEETING

Notice is hereby given that the Annual General Meeting of the British Medical Association will be held in the Great Hall, British Medical Association House, Tavistock Square, London, W.C.1, on Wednesday, July 25, 1945, at 12.30 p.m. Business: (1) Minutes of the last meeting; (2) appointment of auditors; (3) report of election of President for 1945–6.

CHARLES HILL,
Secretary.

Branch and Division Meetings to be Held

EAST SOMERSET DIVISION.—At Weston-super-Mare Hospital, Sunday, June 24, 3 p.m. General meeting open to all practitioners. Dr. A. C. Hincks: Report of Special Representative Meeting; election of representative and deputy representative in Representative Body; instruction of representatives.

EAST SUFFOLK DIVISION.—At East Suffolk and Ipswich Hospital, Wednesday, June 20, at 8.15 p.m. Agenda: Report of Representative on Representative Meeting; Lecture on "Female Endocrinology" by Mr. F. R. Stansfield.

ISLE OF WIGHT DIVISION.—At Osborne House, Shanklin, Friday, June 22, 3 p.m. Annual meeting. Agenda: Consideration of Annual Report of Council; etc. B.M.A. members, including Service medical officers, are requested to attend. 3.30 p.m., lecture by Surg. Rear-Admiral C. P. G. Wakeley: D-Day Surgery. All island medical practitioners are invited.

MID-CHESHIRE DIVISION.—At Altrincham General Hospital, Sunday, June 24, 3.30 p.m. Annual meeting. A meeting of the whole profession will also be held on that date to elect the Local Medical War Committee.

MONMOUTHSHIRE DIVISION.—At Royal Gwent Hospital, Saturday, June 16, 3.30 p.m. Annual meeting. Election of officers and discussion of Annual Report of Council.

SURREY BRANCH.—At Warlingham Park Hospital, Warlingham, Wednesday, July 4, 2.45 p.m. Annual general meeting. President's address: Eugenics and Post-War Reconstruction; followed by cinematograph performance.

WESTMINSTER AND HOLBORN DIVISION.—At Westminster City Hall, Charing Cross Road, W.C., Thursday, June 21, 8 p.m. General meeting. Agenda: Report of representatives to Special Representative Meeting; Consideration of Annual Report of Council 1944–5; Consideration of motions for Annual Representative Meeting and instruction of representatives, etc.

B.M.A. LIBRARY

The following books were added to the library during January and February, 1945:

Anderson, W. A. D.: Synopsis of Pathology. 1942.
Bates, W. H.: The Bates Method for Good Sight without Glasses. 1944.
Brend, W. A.: Foundations of Human Conflicts. 1944.
Brown, W.: Psychology and Psychotherapy. Fifth edition. 1944.
Cameron, A. T.: Recent Advances in Endocrinology. Fifth edition. 1945.
Colson, J. H. C.: The Rehabilitation of the Injured. 1944.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: Primary F.R.C.S. course: lecture-demonstra in anatomy, physiology, pathology, and bacterio Mon., Wed., and Fri., from 6 p.m. to 8.15 Aug. 13 to Oct. 12. (2) Week-end course in nose, and throat diseases, at Metropolitan Nose, and Throat Hospital, all-day, Sat. and S June 30 and July 1. (3) Week-end course in obs rics and gynaecology, South London Hospital Women, Sat. and Sun., July 14 and 15; (4) We end course in medicine and surgery, Hampst General Hospital, all-day, Sat. and Sun., Ju 21 and 22.

WEEKLY POSTGRADUATE DIARY

EDINBURGH POSTGRADUATE LECTURES.—At Edinburgh Royal Infirmary, *Thurs.*, 4.30 p.m., Dr. C. Kelman Robertson: Post-operative Pulmonary Complications.

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*West End Hospital for Nervous Diseases*. Mon., Tues., and Fri., 2.30 p.m., M.R.C.P. course in neurology.

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE.—*Wed.*, 2.15 p.m., Section of Comparative Medicine. *Sat.*, 2.30 p.m., Section of Orthopaedics.

ROYAL SOCIETY OF TROPICAL MEDICINE AND HYGIENE.—At 26, Portland Place, W., *Thurs.*, 3 p.m., Annual general meeting; 4 p.m., reception and tea in library and Fellows' room.

WEST LONDON MEDICO-CHIRURGICAL SOCIETY.—At Kensington Town Hall, *Tues.*, 8.30 p.m., Cavendish Lecture by Lord Moran: The Art of Command.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. for 18 words or less. Extra words 3s. 6d. for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.

BIRTHS

RICHARDS.—On June 7, 1945, at Bristol, to Dr. Megan Richards (*née* Evans), wife of Capt. R. O. Richards, F.R.C.S., R.A.M.C., a daughter.

WATTS.—On June 3, 1945, at the Hill Nursing Home, Reading, to Joan (*née* Inwood), wife of Major J. C. Watts, R.A.M.C., a son.

FORTHCOMING MARRIAGE

MAJOR W. K. S. MOORE—MISS D. M. BROWN.—The engagement is announced between Majo. W. K. Stevenson Moore, R.A.M.C., S.E.A.C., son of Mr. and Mrs. W. L. Stevenson Moore, 7, South Meade, Timperley, Cheshire, and Dorothy Margaret, younger daughter of Mr. and Mrs. J. Hastings Brown, 25, Frederick Street, Edinburgh.

MARRIAGES

LANGE—GILES.—On June 1, 1945, at Lymington, Squad. Ldr. M. J. Lange, M.R.C.S., R.A.F.V.R., to Joyce Giles, of Fawley, Hampshire.

MACLEAN—HAUPT.—On May 31, 1945, at Christ Church, Friern Barnet, George Todd Maclean M.A., M.B.Glas., to Mrs. Edith Nina Haupt.

DEATH

MOIR.—On June 7, 1945, at Swadlincote, shire, John Hay Moir, D.S.O., M.C., M.D., D.P.H., husband of Elizabeth McDiermid, Edinburgh.

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL
LONDON SATURDAY JUNE 23 1945

British Medical Association

SUPPLEMENTARY ANNUAL REPORT OF COUNCIL, 1944–5

y member is asked to keep this Supplement, with the earlier one of May 12, until the subjects have been discussed by his Division

Negotiating Committee

[illegible]. The report of the proceedings of [illegible] Special Representative Meeting held [illegible] May, which, at the request of the [illegible]istry of Health, was not made public, [illegible] been sent to every member of the [illegible]fession. The Council has considered [illegible] resolutions referred to it by the meeting [illegible] has passed a number of them to the [illegible]gotiating Committee. The Negotiating Committee has met to receive observations from its constituent bodies and has had another meeting with the Minister. Further progress must now await the result of the General Election.

Relationship of Parent Association to the Medical Association of South Africa

64. During the past year there has been correspondence between the Council and the Federal Council in South Africa on the relationship of the Medical Association of South Africa with the parent Association. The Medical Association of South Africa is an Incorporated Group of Branches with the powers defined in Article 13 of the Articles of Association, and it has entered into an Agreement with the parent Association in conformity with Article 13 (7) and Bylaw 21. It will be remembered that a desire for separation was expressed before the war by members in South Africa, and that conversations on the subject were suspended after the outbreak of hostilities. The matter has now been reopened, and, as a result of representations received from South Africa, the Council cabled that if the majority of members in South Africa desired to abrogate the existing agreement preparatory to affiliation, the Council would unhesitatingly meet their wishes. The Federal Council consulted the members in South Africa by means of a referendum, asking all members: (1) whether or not they wished the Federal Council to take the necessary steps to achieve independent and self-governing status instead of remaining as a corporate group of branches of the B.M.A.; and (2) whether they were in favour of the Association in South Africa with an independent and self-governing status being affiliated to the parent body. The result of the voting in the referendum was 700 in favour and 201 against. The membership of the Medical Association of South Africa is 2,500.

The Council, in conformity with the promise made to the Federal Council that it would give effect to the wishes of the members in South Africa, has taken [illegible]e necessary steps to abrogate the existing [illegible]reement between the Medical Association [illegible] South Africa and the parent Association [illegible] to initiate discussions for a form of [illegible]ion.

Medical Representation in Parliament Fund

65. In 1919 the Association established a Medical Representation in Parliament Fund with as its main object the provision of financial assistance to prospective Parliamentary candidates who were likely to prove effective in presenting the profession's point of view in Parliament.

The Fund was not widely supported, though no one doubts the advisability of having in Parliament medical men and women who can present the point of view of the organized profession. A number of practitioners have come forward as candidates at the General Election, and in several cases an appeal has been made to the Association for contributions towards their election expenses. The Association's own funds cannot be used legally for this object, and the Council has decided that steps must be taken to revive the Medical Representation in Parliament Fund, and to invite voluntary subscriptions from members. The Council believes that doctors generally are more alive than formerly to the need for such a Fund, and that the response to an appeal for subscriptions may now be more successful. It proposes to make the first appeal in the autumn. A Parliamentary Elections Committee has been appointed to administer the Fund on behalf of the Council.

Regional Organization of the Association

66. The Council has given further consideration to the proposed regional organization to which reference was made in para. 46 of its Annual Report. The Council has come to the conclusion that the time has not yet arrived to set up a full-scale regional organization. To do so would involve the appointment of six whole-time regional secretaries with offices and staffs in various parts of the country, at a cost at the outset of about £12,000 a year. The Council fully recognizes the need to promote close and continuous contact between the central body and the periphery, and to help local secretaries in their work in developing Association activities in the Divisions and Branches.

The development favoured by the Council as an immediate step, without prejudice to future development in the light of experience, is the appointment to the Association's medical staff of additional assistant secretaries who would spend a large proportion of their time visiting Divisions and Branches to stimulate and help local activities.

If the Representative Meeting approves, immediate steps will be taken to make such appointments, allowing sufficient time for Service candidates to apply.

Cost-of-living Bonus

67. Since the submission of the Association's evidence to the Commission on Equal Pay, which was referred to in para. 33 of the Annual Report, the Council has learnt that local authorities which discriminate between the sexes in the payment of cost-of-living bonus include the bonus in the assessment of remuneration for purposes of superannuation. This means that the lower rate of bonus paid to women retiring during the period of bonus award might result in their pensions being permanently less than those of men receiving the same salary. The Council has expressed the opinion that the cost-of-living bonus should be the same for medical women as for medical men, and this opinion is being circulated to the Ministry of Health and the Associations of Local Authorities.

Care of Homeless Children

68. The Association has been invited to submit evidence to the Interdepartmental Committee on the Care of Homeless Children. The Council has accordingly appointed a committee to prepare a memorandum of evidence on the medical aspects of the problems involved.

Vaccination

69. The Ministry of Health invited the observations of the Association on the general question of continuing the existing compulsory system of vaccination. It will be remembered that the Association's Committee on Immunization, which issued its report in 1935, expressed the view that there was no reason why compulsion as regards vaccination should be continued permanently in its present unsatisfactory form. Immunization against infectious diseases involved a common scientific principle and called for a co-ordinated practical effort.

The Council has informed the Ministry of Health that it is of the opinion that the present compulsory system of vaccination should be terminated, but the Government should have powers which could be enforced immediately in the event of smallpox becoming endemic or epidemic. The Government should make itself responsible for acquainting the public with the value of vaccination. The Council believes that more children would be vaccinated if parents were encouraged to take them to their own doctors, who should receive a fee from local authorities for each vaccination. The Council also considers that the Government should be responsible for the preparation, provision, and immediate availability of lymph.

H. GUY DAIN,
Chairman.

Subject to Audit.

PROCEEDINGS OF COUNCIL

A meeting of the Council was held on Wednesday, June 13, with Dr. H. GUY DAIN, Chairman of Council, in the chair.

Preliminary

A message was read from the B.M.A. South Australian Council expressing to the parent Association the deep regret of the Council on learning of the death of the President, Viscount Dawson of Penn. "The loss of one who has achieved world fame, especially coming at a time like the present, is a very heavy one, and a great blow to the medical profession throughout the world."

A letter was read from Sir Alfred Webb-Johnson, President of the Royal College of Surgeons of England, acknowledging the donation by the Association of one thousand guineas to the Restoration and Development Fund of the Royal College. The letter continued:

> "It is a great encouragement to us in our work to receive the support of your great Association, which is representative of the whole medical profession. The gift is welcome not only for the substantial help which it will give towards the objects we have in view, but also as a further evidence of the cordial relations between the Association and our College. It has been one of the happiest experiences of my period of office as President of the College to have had such friendly relations and such fruitful co-operation with the British Medical Association."

At its last meeting the Council agreed to the appointment of a Medical Curriculum Committee. The personnel of the committee was now agreed to; it consisted of the officers of the Association, eleven other members of Council, four other members of the Association who are concerned with medical education, and one representative of the British Medical Students' Association.

A memorandum which has been sent to the Lord President of the Council by the Royal College of Physicians and the Royal College of Surgeons suggesting that at the moment there is no need for, and no possibility of, establishing a statutory list of consultants and specialists was laid before the Council. On the motion of Dr. J. A. Ireland, seconded by Dr. Peter Macdonald, the Council concurred with the view that the time was not opportune for the establishment of a statutory list.

The Negotiating Committee

The Chairman said that the Council had next to receive the resolutions passed by the recent Special Representative Meeting. These had been divided into two categories—namely, those directly proposed as instructions to the Negotiating Committee and those referred for action by the Council. The Negotiating Committee had met once since the Special Representative Meeting, and had met the Minister, and the main points which emerged from the Representative Meeting had been put to the Minister. On the previous day the Minister had made his statement in Parliament, and as far as appeared from reports in the Press he had not committed himself to anything. He had left the matter quite open, and had observed what the Negotiating Committee had impressed upon him—that the profession did not wish to be embroiled in the parliamentary elections or to see the question of a National Health Service made a party issue. Mr. Willink had not said anything in his statement in Parliament which would provoke any kind of political wrangle. He had made a general and in no sense a detailed statement, and only to the extent to which he was pressed did he refer to the discussions on the White Paper.

Concerning the various resolutions, the Chairman said that those which took the form of instructions to the Negotiating Committee would be used by that committee as a background for its further work.

The Council then considered in detail the resolutions which had been referred to it, as distinct from the Negotiating Committee. Some of these were also sent to the committee with the Council's endorsement; in a small number of cases it decided that it could take no action. Others had been anticipated, or the proposals were already being explored.

Practitioners' Right of Appeal

One resolution of the Special Representative Meeting and a number of others from the Annual Representative Meeting, held in December last, concerned the right of appeal to the courts by a practitioner in the event of any case of dispute arising within the scope of his contract under a National Health Service, and on this some discussion took place in the Council.

Dr. R. Forbes said that it would be well to exercise some caution concerning this right of appeal. Not infrequently a complainant, having succeeded against the practitioner on the ground of negligence in a complaint laid before the insurance committee, took the matter to the courts, thereby creating a situation which was particularly difficult for the practitioner to defend. Had the practitioner been in a position to appeal against the decision of the committee he might have succeeded in getting it reversed; but the practitioner had to appear by himself, or with friends, without paid legal aid, and was at a distinct disadvantage. Cases which came before Medical Service Subcommittees were mainly of one of two categories—either technical breaches, or of a major order imputing negligence. With regard to the latter the question of appeal was pertinent, and was one which should be pursued; but, on the other hand, there were many matters of a domestic character which ought to be settled without recourse to the courts.

It was agreed after some further discussion that the Insurance Acts Committee should be requested to furnish the Negotiating Committee with a complete outline of the present disciplinary machinery with a view to a consideration by the Negotiating Committee of the whole question.

The Association and Science

On the recommendation of the Science Committee, brought forward by Mr. Zachary Cope, it was agreed that the award of the Association's scholarships, grants, and prizes should be resumed at the earliest possible moment—probably, it was stated, early next year. Dr. R. G. Gordon suggested that the Association might well increase its scientific activities. The scientific work of the Association, which was considerable, was rather masked at present by the immense amount of medico-political activity. An increase of £500 in the budget for scientific work would not straiten the Treasurer.

It was also agreed that the regulations as to research scholarships, which provide that a scholar shall not receive from the Association a sum greater than the amount required to bring the total sum received during one year to £400, should be amended by the deletion of that provision, and the insertion of: "A scholarship of the British Medical Association may be held concurrently with another scholarship." It was felt that candidates for research scholarships at this stage might be older than in pre-war years and would consequently in most cases have greater responsibilities.

On a suggestion by Dr. H. B. Morgan it was agreed that arrangements should be made for a lecture to be given under the auspices of the Mackenzie Industrial Health Lecture Fund. This is one of the Association's trust funds, formed in 1940, when the Industrial Health Education Society, on its liquidation, transferred its surplus funds, amounting to £350, to the B.M.A. for the purpose of founding a memorial lecture.

Compulsory Vaccination

Prof. R. M. F. Picken, chairman of the Public Health Committee, said that the committee had considered a letter from the Ministry of Health proposing, on the advice of the Minister's Medical Advisory Committee, that the existing compulsory system of vaccination should be terminated, and asking for the observations of the Association. At the present time about one-third of the infants born in this country were vaccinated. This meant that a very small proportion of the whole community could be regarded as immune from smallpox. The Public Health Committee had, after consideration, recommended that the following observations be submitted to the Ministry of Health:

> The proposals now being made by the Ministry of Health are in accordance with the recommendations made by the Association's Committee on Immunization, published in 1935. This committee concluded its report with the following opinion:
>
> > It is extremely unlikely that immunization against each disease, as it becomes practicable, could be made compulsory in this country. There appears to be no reason why compulsion as regards vaccination, which is evidently unwelcome to a large proportion of the people, should be continued permanently in its present unsatisfactory form. Immunization against infectious diseases involves a common scientific principle and calls for a co-ordinated practical effort. The first thing essential is that the public should be informed as to what can be achieved by immunization, and that it is the controlled application, with infinitesimal risk, of a process which is going on continuously in a haphazard fashion, so far as endemic diseases are concerned, leaving behind it a trail of suffering and death.
> >
> > The individual practitioner, who is constantly consulted on such matters, can take a leading, perhaps a predominant, part in public education of this kind. The organization, however, of the necessary machinery for placing immunization at the disposal of the public and bringing its benefits prominently before them is a function of the local authorities under the co-ordinating influences of the Ministry of Health. Such an organization should be of a kind which can readily undertake the advertising and carrying out of immunization against each disease as it becomes widely applicable, and also the enforcement of compulsion if it should remain, in the case of vaccination, or become necessary from time to time under regulations directed to that end.

The Council is of the opinion that the present compulsory system of vaccination should be terminated, but the Government should have powers which could be enforced immediately in the event of smallpox becoming endemic or epidemic. The Government should make itself responsible for acquainting the public with the value of vaccination, and the Council believes that more children would be vaccinated if parents were encouraged to take them to their own doctors, who should receive a fee from local authorities for each vaccination. Finally, the Council considers that the Government should be responsible for the preparation, provision, and immediate availability of lymph.

The committee, Prof. Picken added, wanted to emphasize its view that the Minister should take powers to ensure that compulsory vaccination was applied if necessary in any part of the country where serious need arose for it to be carried out. Personally he did not think that this would be necessary, because, even in areas where vaccination was most disregarded, should there be any threat of smallpox there was immediately a rush of persons anxious to have themselves and their children vaccinated.

The Council agreed to the recommendation.

Salaries of Whole-time Public Health Medical Officers

On the recommendation of the Public Health Committee the Council gave general approval to a proposed revision, by the Society of Medical Officers of Health, of the Askwith scale relating to salaries of whole-time public health medical officers. It was agreed that the proposed scale be transmitted to the body in charge of the negotiations, together with certain observations by the Public Health Committee. The observations had to do with relatively minor matters of detail concerning grading and titles.

Prof. Picken said that the committee had borne in mind the possible repercussions on professional remuneration generally of any recommendations which might be put forward at the present time. The scales now proposed represented a substantial but not an inordinate increase on the existing scales, but it was difficult to say what was the percentage of increase because new types of scale and gradations were suggested, and therefore the lists were not comparable. The negotiating body would be the B.M.A., and he hoped that the new scales would be pressed for very hard.

Discussion took place on the comparison between the proposed remuneration for public health medical officers and that which a general practitioner might expect. It was pointed out that in any comparison certain differential factors must be taken into account, such as the assurance of a pension in the case of a medical officer employed by an authority, his security of occupation, and, perhaps most important of all, the deduction for practice expenses to which the total remuneration received by the general practitioner was subject.

It was also mentioned that the first results of the inquiry into general practitioners' remuneration were now available and would come during the following week before the committee which was engaged in preparing evidence.

The Medical Association of South Africa

Dr. J. C. Matthews, chairman of the Organization Committee, brought forward a report on the relationship of the parent Association to the Medical Association of South Africa. At a previous meeting it had been agreed to send a cable to the secretary of that Association stating that if the majority of his members firmly desired to abrogate the agreement entered into in 1926 and preferred some form of affiliation the parent Association would unhesitatingly meet their wishes. A referendum had taken place in South Africa, as a result of which 700 were in favour of abrogation and 201 against. The proposal submitted to this referendum included the arrangement for the South African Association to act as an independent and self-governing body in affiliation with the B.M.A., on such terms and conditions as might be found mutually acceptable to the Representative Body of the B.M.A. and to the Federal Council of the South African Association.

Dr. Matthews said that the Organization Committee had felt that there was no alternative but to proceed to discover whether South Africa would agree to affiliation somewhat on the lines of the existing relationship with Canada, though some of them felt that certain improvements might be made upon that. The committee had had the advantage of conferring with Brigadier A. J. Orenstein, a former president of the Federal Council and a vice-president of the B.M.A., and with Dr. Alfred Cox, who took a prominent part in the negotiations twenty years ago. He moved a recommendation which had been drawn up by the solicitor giving effect to the wishes expressed in South Africa.

This recommendation was agreed to, and it was understood that six months' notice would be given by cable to terminate the agreement as from Dec. 31 next. The Council also agreed to refer it to the Organization Committee to prepare proposals for affiliation between the Association in this country and the profession in South Africa. It was mentioned that affiliation would require the approval of the Representative Meeting.

In reply to Dr. Gregg, Dr. Matthews said that it would be possible to arrange for the affiliation with the Association of individual members in South Africa as well as the affiliation of their Association itself. Such members on visiting this country would have the privileges of membership, and in South Africa they would, of course, receive the *Journal*.

Proposed Group of Homoeopathy

Dr. Matthews said that his committee had given consideration to a petition signed by 87 members of the Association that a Group of Homoeopathy be established within the B.M.A. The committee had been assisted by an excellent memorandum on the subject prepared in the office. It reviewed the whole problem, dealing entirely with the medico-political aspects of the matter and not touching on questions of scientific theory. After considering this memorandum the committee recommended that the Council should express the view that no case had been made out for the establishment of a Group of Homoeopathy.

Dr. F. H. Bodman said that he was physician to a homoeopathic hospital, for twenty years he had served on the Board of Management of that hospital, he had also served on the council of the British Homoeopathic Society, and he was a Fellow of the recently organized Faculty of Homoeopathy. Speaking, therefore, to some extent as representative of homoeopathists in the Association, he regretted that he had not had the opportunity to study the memorandum, which had been placed before the members only on the day of the Council meeting. It was a closely argued statement, but it contained one or two misconceptions. Perhaps the petitioners had weakened their case by including members who already belonged to other Association groups, but this affected only three or four out of the 87. Perhaps it might be argued that homoeopathy, notwithstanding what was stated in the memorandum, could be considered as a specialty. It was not a subject which could be picked up quite easily; it was a long and difficult art as well as a science. The homoeopathist had not only to diagnose the patient in the terms of his disease but also in the terms of the drug to which he was susceptible. Homoeopathic medicines were different and administered in a different way from the drugs used by the orthodox profession. It had been argued that the treatment of patients by medicines was going to be a diminishing part of the doctor's work, but personally he saw no evidence of that at present. The homoeopathist, like his orthodox colleague, was interested in preventive medicine and would claim that by his methods of treatment he was able to prevent disease as well as anybody else. The petitioners had stated definitely that their professional interests, as distinct from their scientific interest, were different from those of the general body of the profession. If a National Health Service came in it would involve special difficulties for homoeopathists; as, for example, in connexion with appointments to hospitals and with prescriptions. In reply to a question, he said that the total number of active homoeopathic practitioners in this country was approximately 200, including 34 practitioners who were engaged in National Health Insurance and were prescribing National Health Insurance medicines. He moved the reference back of the recommendation.

Dr. R. W. Cockshut, in supporting the reference back, asked what would be the position of homoeopathists in a comprehensive health service. Their practices were scattered, and they drew their patients usually from quite a large area. He foresaw difficulties which might arise under any new national organization. As himself an "orthodox" doctor, he also viewed with misgiving a situation in which homoeopathists might come to be considered by the public as a different sort of doctor, so that people would increasingly go to them on that account. He was therefore in favour of forming them into a group within the Association, although he could not say that they were specialists in the true sense of the word.

Dr. J. A. Pridham pointed out that the recommendation simply said "no case has been made out." It would be open to their homoeopathic brethren to make out a further case, and no doubt the Organization Committee would duly consider it.

The recommendation was carried by a majority.

Regional Organization

Dr. Matthews reminded the Council that at its previous meeting it had agreed that a regional organization of the Association should be set up covering five regions in England and Wales. The Organization Committee had now given further consideration to this matter, and had come to the conclusion that as a whole-time regional secretary must be appointed for Wales, in conformity with the decision of the last Annual Representative Meeting, it would be necessary for the regional organization to cover six regions instead of five. The six regions would be the North-Western, centred in Manchester, the North-Eastern, centred in Leeds, the Greater London, the South-Eastern, also centred in London, the South-Western, centred in Birmingham or Bristol, and the Wales and Monmouthshire region, centred in Cardiff.

Dr. S. Wand suggested that the Association was moving a little too fast. There would be a regionalization of the country under the new National Health Service. Could the present proposal not be held over until it was seen what form these regions would take? Dr. Matthews agreed that the plan might want modification when it was known what the regions under the National Health Service were to be. Dr. Cockshut said that he was rather concerned at the optimistic view they were taking of the Association's future income. Each of these regional organizations would cost the Association not less than £2,000 a year. Dr. O. C. Carter said that he failed to understand the necessity for decentralization in view of the comparatively small area of this country.

The Chairman pointed out that the Representative Meeting had instructed the Council to go on with regional organization. He also suggested that one of the results of appointing regional secretaries might be expected to be increased membership, which would go some way to meet the additional expenditure. Dr. Wand wondered whether they were wise in jumping from a temporary experiment in one area (the appointment of a regional secretary in the Metropolitan Counties area before the war) to the complete regionalization of the country. Prof. Picken said that, while he had never been an enthusiastic supporter of regionalization for this purpose, he was quite clear that the Representative Body had been determined about it, and decisions must not be put off for too long. Dr. C. N. Binney thought that the Representative Body had not appreciated what the plan would entail financially, and might change its opinion if this were explained.

Dr. H. H. D. Sutherland suggested three major divisions instead of six—namely, Midland and North, West and South-West, including Wales, and London and the Southern and Eastern counties. The Chairman said that he thought Greater London and the South-Eastern might well be one region.

The Secretary (Dr. Hill) said that the stimulus for this scheme came year after year preceding the war from the Representative Body. If the Council had doubts on the subject he thought it should put forward a reasoned statement to the Annual Representative Meeting. But it was important to ensure a larger measure of support for the honorary secretaries in the Divisions, and to have more medical man-power in the form of secretariat to help in local activities at the request of Divisions. The issue was whether it was preferable to have additional officers working from London or to have such officers stationed in the regions.

Dr. E. A. Gregg suggested that some of the activities of the Association in the future might be of such a character that it would be very important to have as strong an organization as possible in the outer areas. Dr. F. Gray said that probably the best solution for the moment would be to appoint additional members of the staff centred in London, and then later, if considered desirable, to decentralize the organization.

After further discussion it was agreed that as a preliminary step certain necessary additions be made to the central medical secretariat in order to make possible the extension of the work and the assistance of local units. In reply to Dr. Vaughan Jones, the Chairman said that he did not regard this as a direct negative; the Council was not deciding against regionalization altogether, but it considered that the most effective way was to start at headquarters.

Medical Representation in Parliament

Dr. Guy Dain, as Chairman of the Medical Representation in Parliament Committee, said that the newly appointed committee had again gone into this difficult question of medical representation in Parliament, and it now came to the Council to ask approval of the re-establishment of the Medical Representation in Parliament Fund, which had been allowed to fall into disuse. It thought that if a proper effort were made after the general election they might get the Fund re-established and well supported by members of the Association.

This was agreed to, and it was also agreed to put the Parliamentary Elections Committee on a permanent basis with the following members: The officers of the Association, Mr. Zachary Cope, Dr. E. A. Gregg, Dr. H. R. Frederick (or other representative of Wales), Dr. J. B. Miller, Dr. J. G. Thwaites, Dr. S. Wand, and a representative of the Medical Women's Federation.

Other Business

A report of the Building Committee, mainly concerning tenancy agreements, rentals, and accommodation at B.M.A. House, was presented by Mr. A. M. A. Moore and adopted.

Dr. G. MacFeat introduced the report of the Scottish Committee, the principal matter in which concerned alternative proposals for the National Health Service applying to Scotland only, on which the Secretary of State had sought the views of those concerned.

The Council decided that the election of oversea members of Council should be resumed next year. Members representing oversea Branches were last elected in 1938.

On the proposition of Dr. Peter Macdonald, the retiring Chairman of the Representative Body, it was agreed that, in addition to railway fare, subsistence and other out-of-pocket expenses of the Chairman of the Representative Body, when engaged on B.M.A. business, should be paid by the Association as from August next.

A report was made by Dr. Matthews on the conference on international medical relations, arranged by the International Relations Committee, which took place on June 6, when doctors from Belgium, the Netherlands, Poland, Yugoslavia, and the United States were present. Dr. Decourt, Secretary of the A.P.I.M., and Dr. Cibrie, Secretary of the Confédération des Syndicats Médicaux, came from Paris specially for the conference. Dr. Matthews said that his own feeling was that the calling of the conference was somewhat premature, because the medical organization in recently occupied countries had not yet been re-established. But it was decided to call a conference, in which the B.M.A. would co-operate with the A.P.I.M., during the early months of 1946, and it was hoped that by that time the national medical organizations in Europe would have sufficiently revived to take part.

The Council gave further consideration to the question of the differentiation in the cost-of-living bonus for men and women officers of public authorities. Prof. Picken said that one new fact had emerged—namely, that local authorities regarded the bonus as being part of remuneration and included it for the purposes of superannuation; therefore the lower rate of bonus paid to women retiring during the period of bonus award would result in their pensions being permanently less than those of men receiving the same salary. The Council agreed to a recommendation expressing the opinion that the cost-of-living bonus should be the same for women as for medical men, this opinion to be forwarded to the Ministry of Health and to local authorities.

The last business of the Council was to elect as members of the Association 75 candidates who are serving with His Majesty's Forces.

POSTGRADUATE EDUCATION OF SERVICE MEDICAL OFFICERS

A brief outline of the Government's scheme for the postgraduate training of medical officers on release from the Forces was published in these columns on April 21 (p. 61). In it medical officers were told that they should, on release, apply personally or in writing to their university or medical school, or to the university nearest to where they are living, or to a Central Office to be set up by the University of London, which would act not only for all the London medical schools but also as a clearing house for England and Wales. There would also be an associated Scottish clearing house set up c/o The Dean of the Faculty of Medicine, The University, Edinburgh. At each university a committee for postgraduate medical education was being formed, with a dean or director, to assist officers on release from the Forces.

The Ministry of Health now announces the addresses at the universities or medical schools to which doctors on release from the Services should apply for all information and advice about postgraduate facilities. They are as follows:

Birmingham : Prof. W. H. Wynn, M.D., F.R.C.P., Director of Postgraduate Studies, The Medical School, Hospital Centre, Birmingham, 15. Telephone: Selly Oak 1162.

Bristol : Prof. C. Bruce Perry, M.D., F.R.C.P., Department of Medicine, Canynge Hall, Whatley Road, Bristol, 8. Telephone: Bristol 35828.

Cambridge : Dr. A. C. D. Firth, F.R.C.P., Trinity Hall, Cambridge. Telephone: Cambridge 5047, Ext. 17.

Durham : Prof. R. B. Green, F.R.C.S., Dean of Medicine, Medical School, King's College, Newcastle-upon-Tyne, 1. Telephone: Newcastle-upon-Tyne 21601.

Leeds : Mr. George Armitage, F.R.C.S., School of Medicine, Leeds, 1. Telephone: Leeds 20071 (asking for the secretary of the medical school).

Liverpool : Prof. T. B. Davie, M.D., F.R.C.P., Dean of the Faculty of Medicine, University of Liverpool. Telephone: Royal 5460.

London (Central Office): The Director, Central Office, British Postgraduate Medical School, c/o London School of Hygiene and Tropical Medicine, Keppel Street, W.C.1. Telephone: Museum 3041.

Oxford: Major-Gen. Sir Robert McCarrison, M.D., F.R.C.P., 41, St. Giles', Oxford. Telephone: Oxford 47582.

Manchester: Dr. G. J. Langley, F.R.C.P., Dean of Postgraduate Medical Studies, The University, Manchester, 13. Telephone: Ardwick 2681.

Sheffield: Prof. E. J. Wayne, M.D., F.R.C.P., Department of Pharmacology and Therapeutics, The University, Sheffield, 10. Telephone: Sheffield 20540.

Wales: The Secretary, Welsh National School of Medicine, 10, The Parade, Cardiff. Telephone: Cardiff 3280.

Scotland (Central Office): Prof. Sidney Smith, M.D., F.R.C.P.Ed., Dean of the Faculty of Medicine, University New Buildings, Edinburgh, 8. Telephone: Edinburgh 41001.

DECLARATION OF HEALTH POLICY BY MR. CHURCHILL

Mr. Churchill, in his declaration of policy to the electors, outlines a four-year plan for Britain. The section on health is as follows:

Health

The health services of the country will be made available to all citizens. Every one will contribute to the cost, and no one will be denied the attention, the treatment, or the appliances he requires because he cannot afford them. We propose to create a comprehensive health service covering the whole range of medical treatment from the general practitioner to the specialist, and from the hospital to convalescence and rehabilitation; and to introduce legislation for this purpose in the new Parliament.

The success of the service will depend on the skill and initiative of doctors, dentists, nurses, and other professional people, and in its designing and operation there will be full scope for all the guidance they can give. Wide play must be given to the preferences and enterprise of individuals. Nothing will be done to destroy the close personal relationship between doctor and patient, nor to restrict the patient's free choice of doctor.

The whole service must be so designed that in each area its growth is helped and guided by the influence of a university. Through such a service the medical and allied professions will be enabled to serve the whole nation more effectively than they have yet been able to do. At the same time medicine will be left free to develop along its own lines, and to achieve preventive as well as curative triumphs. Liberty is an essential condition of scientific progress.

The voluntary hospitals, which have led the way in the development of hospital technique, will remain free. They will play their part in the new service in friendly partnership with local authority hospitals.

Motherhood must be our special care. There must be a large increase of maternity beds and convalescent homes, and they must be provided in the right places. Mothers must be relieved of onerous duties which at such times so easily cause lasting injury to their health. The national insurance scheme will make financial provision for these needs. All proper arrangements, both voluntary and State-aided, must be made for the care of other young children in the family, in order that the energies of the male breadwinner or the kindness of neighbours and relations, which nevertheless must be the mainspring, should not be unduly burdened. Nursery schools and nurseries such as have grown up during the war should be encouraged. On the birth, the proper feeding, and the healthy upbringing of a substantially increased number of children depends the life of Britain and her enduring glory.

HEARD AT HEADQUARTERS

The Medical Association of South Africa

A desire has arisen in South Africa for a completely independent Association, affiliated with the B.M.A., but no longer functioning, as at present, as a corporate group of B.M.A. branches. A number of causes have encouraged this trend of opinion. One of them is the fact that the medical profession in South Africa is now largely educated in South Africa and not in Great Britain as in the past. Another cause is the growth of the nationalist spirit, evident in South Africa as in other parts of the world, and affecting the relationship of professional as well as political bodies. The strength of this feeling in South Africa is shown at a medical school opened not long ago in Pretoria in which, notwithstanding textbook difficulties and the like, the teaching is to be entirely in Afrikaans, ability to teach in that language being a condition of appointment even to the lower posts in the faculty. A third reason is an economic consideration—the existence of two medical journals. There are other reasons—such as a desire on the part of a few to introduce trade unionism into the profession—but the three given above seem to be the governing ones.

A referendum has recently been taken on the proposal to abrogate the agreement with the parent Association, and to have a body independent and self-governing, in affiliation with the B.M.A., and the result showed 700 in favour and 201 against. The number of members in South Africa is about 2,500. The total number on the *Register* is 3,700, but this includes many not practising there, and the effective practising strength of the profession is believed to be just under 3,000.

Proposals for Affiliation

A meeting of the Organization Committee, under Dr. J. C. Matthew's chairmanship, was attended by Brigadier A. J. Orenstein, of Johannesburg, a former president of the Federal Council, who was made a Vice-President of the parent Association at the Centenary Meeting, and was largely responsible with Dr. Alfred Cox (who was also present) for bringing about the reorganization of the Association in South Africa twenty years ago. Brigadier Orenstein sketched the position in South Africa, and made some useful suggestions for the basis of the new affiliation. He thought that the request for abrogation should be accepted, although for his own part he would have preferred the present arrangement to continue. He assumed that it would be open to any in South Africa who desired to do so to continue as individual members their association with the B.M.A., but without forming branches. At one time there were in South Africa independent branches of the B.M.A. and of the Transvaal Medical Association, and that position must not be repeated. Such individual members would receive the *Journal*, and on coming to this country would have all the privileges of membership. In Canada, where an affiliation arrangement has existed for many years, the B.M.A. has some thirty or forty unattached members.

The whole of the correspondence on this subject has been conducted in the most amicable spirit, and it was in that spirit that the discussion was continued in the Organization Committee. Brigadier Orenstein said that nowhere, except from an isolated individual or two, had he heard any expression of a desire to break off co-operation. The committee decided to recommend the Council to consent to abrogation of the agreement and to the formulation, under legal advice, of a new agreement of affiliation. It is understood that the agreement with the Canadian Medical Association will be studied as a model. The relation between the London and the Canadian secretariats is continuous and friendly, but the Association out there runs its own affairs without any administrative or financial ties with this country, and there is no obligation upon its members to receive the *Journal*. As Dr. Cox pointed out, the fact that the bond was one only of affiliation did not prevent the Canadian Association from extending a warm invitation to Winnipeg in 1930 and making the visiting Association extraordinarily welcome. Brigadier Orenstein said it was still hoped that when the war was finally over the long-postponed meeting in South Africa, originally projected for 1940 or 1941, would be possible.

Tavistock Square Itself Again

At the time when London seemed likely to be the favourite target of the enemy, and even the Lords and Commons were thinking of evacuating to the Midlands—every official of Parliament, under instruction, keeping a bag ready packed—the B.M.A. wisely took a house at Buxton for use in the event of need, so that there should be no interruption in the necessary business of the Association or the issue of its *Journal*. It is another welcome sign of the return to normal that the house in Derbyshire should now be given up, and the equipment stored there should be finding its way back to London.

Tavistock Square did not escape attention; there was much destruction in its neighbourhood, and on one occasion, but for the promptitude of one of the staff, fire might have destroyed Lutyens's Great Hall. But no occupied part of the house was rendered uninhabitable, and it is now a more brisk centre of activity than ever. There is a long list of organizations desiring tenancy agreements as soon as space is available, but the Association itself also wants more room, especially for the production of the *Journal* and the ever-increasing activities of the Secretarial Department. It is also suggested that there should be a reception room for the use of all departments—a noticeable lack until now—a suitable room for the use of the President and other high officers in which distinguished visitors to the Association's House can be received, and other facilities and amenities.

Too Fast or Too Slow

Those who are wise after the event are said to make the best critics, though not necessarily the most helpful ones or the ones whom it is easiest to tolerate. A certain amount of criticism has been reaching the Association to the effect that the matters on which the Negotiating Committee has been engaged have been unduly rushed. Fortunately this is countered by critics on the other side who say that they have been unduly prolonged. But it is urged in particular that the Special Representative Meeting which was held at the beginning of May should have been postponed until after the General Election.

The fact is, of course, that when the meeting was arranged, and even when it was held, a General Election in the early summer was no more than a possibility. No doubt had it been certain that an election was imminent the meeting would have been postponed until it could be seen what sort of new Government was likely to take shape. But those responsible cannot condemn themselves for having been too precipitate. Had the election been delayed—as it might have been—until the end of the war with Japan, or even for not so long, some social legislation, as the Prime Minister has said, would have been on its way towards the statute book. But even with a prospect of Dissolution not too far away there were distinct advantages in getting on as far as possible with the matters under discussion in view of the possibility of a National Health Bill being read for the first time.

Medical Candidates

A scrutiny of the first list of candidates in the General Election shows that thirty members of the medical profession are standing. No doubt there will be some additions to and withdrawals from the list by nomination day. Of those at present listed, more than half—16—are Labour, five are Independent, three Liberal National, two Conservative, while the Liberal, Common Wealth, Scottish Nationalist, and Welsh Nationalist parties have one each. Labour has its candidates well distributed in England—five are putting up for London constituencies, five for English boroughs, and five for English counties—though there is only one Labour doctor putting up for a Scottish constituency (this number is likely to be increased). Three of the five Independent candidates are standing for university seats. They are Dr. Charles Hill, Secretary of the British Medical Association, for Cambridge; Sir Ernest Graham-Little, who has been the sitting member, for London; and Sir John Boyd Orr for the Scottish seat which he won at a recent by-election.

Correspondence

Postgraduate Education of Ex-officers

SIR,—The proposals for postgraduate education of ex-officers have come to me as a severe shock. Panel practitioners' refresher courses, as provided pre-war and as presumably will be provided post-war to men continuously in practice, for Service doctors! This makes one (and not a few others) think that it is desired that practitioners in general and ex-Service men in particular should be degraded, and that midwifery and child welfare should be taken out of the hands of G.P.s for good.

The least that is needed is a series of separate courses made available for all ex-officers who desire them, including those who were called up within a year or so of qualifying. Midwifery and diseases of women, diseases of children, and the care of the aged are three titles of courses obviously needed. Non-tropical medicine, anaesthetics, and other specialties taken out of the hands of G.D.O.s could be added with evident advantage.

It must be presumed that the cost of such courses together with the delay involved in return to general practice has deterred the planners of the miserable proposed provision. This must be overcome, if necessary, by Service doctors getting together and providing for themselves what is so badly needed.—I am, etc.,

Bombay. WILLOUGHBY CLARK.

Medical Demobilization

SIR,—Dr. J. J. Conybeare suggests (*Supplement*, June 9, p. 108) continuing the dilution of qualified house officers with final-year students, a system which he states has already been used with success. Speaking on behalf of the public, so long under-doctored and with inadequate hospital facilities, I do hope that this system of student house officers will be dropped as soon as possible. Admittedly under supervision it may work up to a point, but there are actual dangers to the public inherent in it. The system is well known to patients, and, owing to the youth of many of the qualified personnel, they have the impression that the junior staffs of teaching hospitals are largely, if not entirely, composed of students.

The class that comprises hospital patients has been more hardly hit by the war than any other. They have borne great suffering with bravery and without complaint. Death has taken many of the old and frail, often while alone and uncared for, owing to dearth of hospital accommodation, nursing facilities, and medical men. With this in view and the hoped-for coming of better hospitals surely every effort should be made to give them as good service as lies in our power and not leave them in charge of the student house officer.—I am, etc.,

London, S.W.1. A. HARBOUR.

SIR,—With reference to the editorial comments on my letter which you published in the *Supplement* of May 26 (p. 78), the point I wished to make was as follows. To the best of my knowledge there has been no hint given as to how long we may be retained in the Services *after our corresponding age and service group has been released.* I can definitely restate that the is no help to be had from the demobilization pamphlet issued by the War Office, and if there have been any explanations in the *Journal* I have not seen them. For all we know this period may be one of weeks, months, or even years. Although I fully realize that it will be impossible to state definitely how long this period will be, I feel that some guidance might be given, so that we can make some sort of plans when we are due for release.

Speaking only for myself, I am very pleased to learn that Class B releases will be few in number, but I am sure that most medical officers of long service will feel considerably relieved by this statement. —I am, etc.,

CAPTAIN, R.A.M.C.

*** The Secretary of C.M.W.C. replies: It is hoped that it will rarely be necessary for medical officers to be retained beyond the dates of release of their age-service groups.

Medical Demobilization and Resettlement

SIR,—With reference to the Central Medical War Committee's letter to temporary serving medical officers, the problems and implications are noted and understood and the letter is timely in allaying a few of our anxieties. Two points, however, not referred to I wish to raise for sincere consideration. One is the question of over-manning, or to put it bluntly "window dressing." The medical requirements of the Forces could be appreciably and practicably reduced if the man-power situation at various Service medical establishments was investigated. On numerous occasions have I indicated to authorities concerned that the work on hand could bear the loss of a percentage of the staff (nurses, attendants, etc.), yet an unrequired relief invariably arrives in the place of one appointed elsewhere.

Secondly, your attention is drawn to the innumerable and unnecessary medical examinations and concomitant documentation enforced upon Service personnel. One rating informed me that he had been through seventeen medical examinations in a year, and others have similar tales to tell, yet they were all "fit for general service" at all times and in the best years of their life. One can only suspect that these superfluous duties are instituted to justify the retention of medical officers where their usefulness is blatantly redundant in their own minds and in the minds of others.

I wish to assure you that my criticism is based upon sufficient information and permits but an element of conjecture: inspection is invited. I trust these two points will be borne in mind if release and repatriation are to be facilitated. —I am, etc.,

R. ALEXANDER,
Surg. Lieut., R.N.V.R

SIR,—It was perhaps unfortunate that the statement in the *Supplement* of March 17 should have reached Service medical officers in the Far East after the first steps of the national demobilization scheme had been put into action. When Service medical officers saw that they were *not*, in fact, being sent home with other members of the Services of the same a/s groups they were justified in feeling some "anxiety lest the release plan for doctors should place them in a less favourable position than other members of the Forces," which your statement was attempting to dispel. They could hardly be blamed for treating the statement with some scepticism.

The simple truth is that the Service medical officer wants fair play and only fair play as compared with other men in the Forces and with doctors in civil practice. If he cannot be given that, he wants to be told why not. He cannot understand why any Service medical officer should be retained after he is due for release under the national scheme so long as there is a doctor in civil practice whose place he could take, and who, after a minimum amount of military training, could replace him.

Much has been written in your columns recently on the ability of the profession to manage its own affairs better than a Government Department. The Service medical officer will be quick to draw conclusions if he finds himself less favourably placed than those demobilized under arrangements made by a Government Department. It is up to the Central Medical War Committee to show the profession that not only will it "spare no effort" but it can "produce the goods."—I am, etc.,

India Comand. MAJOR, R.A.M.C.

Demobilization of Medical Students

SIR,—The question of speed of demobilization of medical students would seem to be of importance to the medical profession and in need of some special consideration. This applies particularly to that small but valuable group of young men who had started their medical studies before the outbreak of war, and after two or three years of study had felt the call to combative service in the Forces so strongly that they *voluntarily* surrendered their reserved status and joined the fighting Services.

In the last war such men were "combed out" in the later stages of hostilities, and many of them have since demonstrated in their medical careers that they were not the least valuable type of recruit to the profession. In the present war such men have relatively high demobilization numbers, because of their low age group, and their return to the study of medicine is likely to be delayed, with real loss to the profession, unless they receive some special consideration. Might not the Central Medical War Committee give some recommendation on this question?—I am, etc.,

WILLIAM BROWN,
Wilde Reader in Mental Philosophy,
London, W.1. Oxford.

*** The Secretary of the Central Medical War Committee states: The committee has already made representations on this matter, which is understood to be still under consideration by the authorities concerned.

Organization of Psychiatric Services

SIR,—Further to Dr. Russell Brain's letter (*Supplement*, June 9, p. 108) I feel with him that Dr. Gordon was suffering under a misapprehension when he stated at the Council meeting that the report of the Joint Committee on the Future Organization of the Psychiatric Service had not taken into consideration the work of Service psychiatrists, and that he knew that there was some feeling among them that their point of view had not had much opportunity of being expressed.

I would like to point out, as chairman of the Psychological Medicine Group Committee of the B.M.A., that the leading psychiatrists from all the three Services took part in the group conference at which they discussed the preparation of the report and also took part in the conference at which the final report was ratified. I would also say that the Planning Committee of the Royal Medico-Psychological Association which dealt with the report had as its chairman Brigadier J. R. Rees, consulting psychiatrist to the Army, and included leading psychiatrists in all the three Services.

It would therefore appear that they had plenty of opportunity to make their feelings known and to have their point of view represented in the report.—I am, etc.,

Bournemouth. DORIS M. ODLUM.

Dr. STEPHEN PASMORE (London, W.8) writes: The members of the Kensington and Hammersmith Division of the B.M.A. are sure they are expressing the feelings of all doctors, when they desire to record in the *Journal* their unbounded admiration for the way in which their wives helped them to carry on their practices throughout the war against Germany.

BRITISH MEDICAL ASSOCIATION

Election of Member of Council by South Wales and Monmouthshire Branch

Notice is hereby given that owing to the failure to elect, a vacancy exists on the Council for the South Wales and Monmouthshire Branch (Group H). Nomination of candidates must be forwarded in writing so as to reach me by July 2, 1945. Candidates must be nominated by either (*a*) a Division or (*b*) not fewer than three members of the Branch.

If more than one candidate is nominated voting papers will be issued on July 14 to each member of the Branch.

CHARLES HILL,
Secretary.

Meetings of Branches and Divisions

READING DIVISION

At a meeting of the Reading Division held on June 7 the following resolution was passed: That this meeting is dissatisfied with its relationship with Birmingham as regards representation on Council and would like to refer the matter to the Branch Council to discuss the election of representatives on B.M.A. Council for smaller areas of the country.

H.M. Forces Appointments

ARMY

War Subs. Major R. R. Bomford, R.A.M.C., to be a Consultant, and has been granted the local rank of Brig.

ROYAL ARMY MEDICAL CORPS

Major A. Hendry has ceased to be re-employed on account of disability, and has been restored to the rank of Lieut.-Col.

Short Service Commission.—Lieut. (War Subs. Capt.) A. M. Buchanan, from Emergency Commission, has been granted a Short Service Commission in the rank of Lieut., and to be Capt.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieut.-Col. W. H. Marston, O.B.E., T.D., has relinquished his commission on account of disability, and has been granted the honorary rank of Colonel.

Lieut.-Col. R. A. Lennie, T.D., having exceeded the age limit, has retired, and has been granted the honorary rank of Colonel.

War Subs. Majors W. M. Nichols and L. C. Bousfield to be Majors.

War Subs. Capt. F. T. Shadforth has relinquished his commission on account of disability and has been granted the honorary rank of Major.

Senior Training Corps.—Major J. M. Smith, M.C., supernumerary for service with St. Andrews Univ. Senior Training Corps (Medical Unit), has resigned his commission and has been restored to the rank of Lieut.-Col.

Lieut. J. F. Goodwin, supernumerary for service with Univ. of London Senior Training Corps (Medical Unit), has resigned his commission.

TERRITORIAL ARMY RESERVE OF OFFICERS:
ROYAL ARMY MEDICAL CORPS

Major J. L. Menzies, M.C., having exceeded the age limit, has relinquished his commission, and has been granted the honorary rank of Lieut.-Col.

Majors J. H. Jordan, M.C., T. R. Kenworthy, M.C., and A. M. Jones, T.D., having exceeded the age limit, have relinquished their commissions, retaining the rank of Major.

LAND FORCES: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

War Subs. Capt. H. M. Symons has relinquished his commission on account of disability, and has been granted the honorary rank of Major.

War Subs. Capt. St. G. E. Harris, O.B.E., has relinquished his commission and has been granted the honorary rank of Major.

War Subs. Capts. T. B. D'Costa, D. W. Stuart, A. E. W. Sandelson, H. V. Sansom, J. H. Redding, and S. C. Mitchell have relinquished their commissions on account of disability and have been granted the honorary rank of Capt.

Lieuts. (War Subs. Capts.) L. A. Daly, A. D. Cassidy, and H. Holden have relinquished their commissions on account of disability, and have been granted the honorary rank of Capt.

Lieut. E. F. Thomas has relinquished his commission on account of disability, and has been granted the honorary rank of Lieut.

To be Lieuts.: R. H. M. Baines, C. G. Ball, A. L. W. Bell, J. A. Blackwood, A. M. Boyd, F. D. Chandler, H. A. Crouch, J. S. Crowther, F. O'N. Daunt, V. Freeman, C. Grant, R. A. Hall, J. A. Hanraty, F. H. Hedges, F. L. Holroyd, L. G. Jackson, H. P. Jones, G. M. A. Lynch, J. McAllister, J. A. McConachie, A. Y. Mason, E. T. G. Meade-Waldo, P. J. Murphy, D. S. Ramsay, A. Sommerville, J. M. Starks, J. M. Stewart, J. Stone, and D. C. Wright.

WOMEN'S FORCES

EMPLOYED WITH THE MEDICAL BRANCH OF THE R.A.F.

Flying Officer A. R. Burrows to be War Subs. Fl. Lieut.

To be Flying Officers (Emergency): Gwenth J. E. Jordan and Madeline K. Keech.

INDIAN MEDICAL SERVICE

Lieut.-Col. G. A. Hildreth has retired.

Capts. A. W. Sampey, J. Reidy, C. L. Greening, and C. B. Jones to be Majors.

POSTGRADUATE NEWS

The Fellowship of Medicine announces: (1) Primary F.R.C.S. course: lecture-demonstrations in anatomy, physiology, pathology, and bacteriology, Mons., Weds., and Fris., from 6 p.m. to 8.15 p.m., Aug. 13 to Oct. 12. (2) Week-end course in obstetrics and gynaecology at South London Hospital for Women, all-day, Sat. and Sun., July 14 and 15, (3) Week-end course in medicine and surgery at Hampstead General Hospital, all-day, Sat. and Sun., July 21 and 22.

On Thursday, July 5, at 2.30 p.m., a demonstration of the technique of a variety of contraceptive methods will be given at the C.B.C. Mothers' Clinic, rear Tottenham Court Road. Medical practitioners and senior students who wish to attend should apply in writing (not telephone) to the hon. sec., 108, Whitfield Street, London, W.1.

WEEKLY POSTGRADUATE DIARY

FELLOWSHIP OF MEDICINE, 1, Wimpole Street, W.—*West End Hospital for Nervous Diseases:* Mon., Tues., and Fri., 2.30 p.m., M.R.C.P. course in neurology. *Metropolitan Ear, Nose, and Throat Hospital:* all-day, Sat. and Sun., June 30 and July 1, week-end course in ear, nose, and throat diseases.

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE.—*Wed.*, 4.30 p.m., Section of Physical Medicine. *Thurs.*, 5 p.m., Section of Urology.

BIRTHS, MARRIAGES, & DEATHS

The charge for an insertion under this head is 10s. 6d. *for* 18 *words or less. Extra words* 3s. 6d. *for each six or less. Payment should be forwarded with the notice, authenticated by the name and permanent address of the sender, and should reach the Advertisement Manager not later than first post Monday morning.*

BIRTHS

GELL.—On June 12, 1945, to Albinia Susan Roope, wife of Dr. P. G. H. Gell, a son—Antony Francis.

MAHER.—On June 8, 1945, at Selly Oak Hospital, to Dr. Mary Veric Maher (*née* Howie), wife of Dr. J. P. Maher, a son.

MARRIAGE

PRIOR—GORONWY.—On June 6, 1945, at Pontypridd, John Renison Prior, Fl. Lieut. R.A.F.V.R., of Grimsby, to Eileen Mary Goronwy, M.R.C.S., L.R.C.P., of Pontypridd.

DEATHS

DONALD.—Lost with H.M.S. *Boadicea*, in the liberation of Europe in June, 1944, Surg. Lieut. William H. C. Donald, R.N.V.R., beloved younger son of the late Robert Donald, *M.C.*, M.D., D.P.H., and of Mrs. Helen Donald, Donachai, Bishopton, Renfrewshire.

HEMPSON.—On June 2, 1945, Geoffrey Oliver Hempson, late of St. Lawrence, Isle of Wight, beloved husband of Dorothy.

TYRRELL.—On June 16, 1945, at 84, Station Road, Sidcup, Edgar J. Tyrrell, M.B., B.S., M.R.C.S., L.R.C.P., D.P.H., D.M.R.E., aged 66. R.I.P.

SUPPLEMENT TO THE

BRITISH MEDICAL JOURNAL

LONDON SATURDAY JUNE 30 1945

MEDICAL CANDIDATES FOR PARLIAMENT

The following, so far as can be ascertained, is a list of the 30 medical men and 3 medical women who are standing at the General Election. The names of those who were members of the last Parliament are indicated by an asterisk. It is not possible in all cases to give the age of the candidates, but the year of their qualification affords some guidance, and this has been inserted, in parentheses, in the few appended biographical notes.

Reginald F. B. Bennett, Woolwich E., Conservative.

(1937). Surg. Lieut.-Cmdr., R.N.V.R. Formerly demonstrator of anatomy at Oxford, later assistant medical officer, Maharaja and State of Rajpipla.

L. Graham Brown, Luton, Liberal National.

(1915). Born in Brisbane. Served throughout 1914–18 war. Now surgeon, Ear, Nose, and Throat Department, Charing Cross Hospital, and president, Section of Otology, Royal Society of Medicine. Early prowess in athletics; captain, England Rugby XV.

Leonard F. Browne, Penrith and Cockermouth, Labour.

(1909). Served in R.A.M.C. as specialist in psychological medicine. Physician, Tavistock Clinic. Closely associated from beginning with Toc H.

Louis Comyns, Silvertown, Labour.

(1932). Received medical training in Scotland. Practises in East London.

*James Douglas Cooke, Hammersmith S., Conservative.

(1902). Received medical training in Australia, and held appointment in Melbourne Hospital. Served in R.A.M.C. in France in first European war. Formerly practised at Stanmore, now retired. Member, Middlesex County Council. Represented Hammersmith S. in Parliament since 1931. Knighted in recent honours list.

*Rt. Hon. Walter E. Elliot, Kelvingrove, Conservative.

(1913). Was Minister of Health 1938–40, and had previously been Secretary of State for Scotland and Minister of Agriculture. Served first European war, gaining *M.C.* and bar. Has represented his Glasgow division since 1924.

G. A. D. Gordon, Richmond, Liberal.

(1931). Major, R.A.M.C.

*Sir Ernest Graham-Little, London University, Independent.

(1892). Consulting physician, Skin Department, St. Mary's Hospital. Member of Senate, University of London, since 1906, and of Court since 1929. Represented the University in Parliament since 1924.

*Leslie Haden Guest, Islington N., Labour.

(1909). Served in South African and first European wars (*M.C.*). Has travelled much as a member of inquiry commissions and in other capacities. Founder of Anglo-French Committee of Red Cross and Order of St. John. Formerly member for Southwark N., and has represented Islington N. since 1937.

Bernard Guyster, Leyton W., Liberal.

(1926). General practitioner in Leyton. Member, Essex County Council and Insurance Committee.

Somerville Hastings, Barking, Labour.

(1902). For many years surgeon-in-charge, Ear, Nose, and Throat Department, Middlesex Hospital. Lately chairman of London County Council and previously chairman of its Hospitals and Medical Services Committee. Has been president, Section of Otology, Royal Society of Medicine. Formerly represented Reading in Parliament. A leading figure in the Socialist Medical Association.

Joseph John Hayward, Abertillery, National.

(1942). Surg. Cmdr., R.N.V.R. Formerly house-surgeon, obstetrical and gynaecological unit, and junior resident anaesthetist, Cardiff Royal Infirmary.

Charles Hill, Cambridge University, Independent.

(1927). Secretary, British Medical Association, since January, 1944, previously Deputy Secretary. Vice-president and formerly chairman, Central Council for Health Education. Member, Minister of Health's Medical Advisory Committee and Minister of Labour's Industrial Health Advisory Committee. Formerly deputy M.O.H., Oxford. Well-known broadcaster.

Elizabeth Jacobs, St. Marylebone, Labour.

(1925). Practising in West London. Formerly clinical assistant, Elizabeth Garrett Anderson Hospital.

Santo Wayburn Jeger, St. Pancras S.E., Labour.

(1923). Practises in North London and has taken a prominent part in local government in Shoreditch; chairman of Public Health Committee.

Eric Frederick St. John Lyburn, Tonbridge, Independent.

(1930). Practises at Tunbridge Wells. Active member, East Sussex Medico-Chirurgical Society.

*Robert Douglas MacIntyre, Motherwell, Scottish Nationalist.

(1938). Practises in Edinburgh. Entered Parliament after recent by-election.

Guy Chandler Milner, Orpington, Independent.

(1926). Practises in the Orpington and Sidcup area of Kent. Lecturer and examiner, British Red Cross. Medical officer to several insurance companies.

*H. B. Morgan, Rochdale, Labour.

(1909). War service 1914–19. Advisory medical officer, Union of Post Office Workers, and adviser and consulting specialist, industrial diseases, Trades Union Congress. Member B.M.A. Council and has served on many headquarters committees. Member for Rochdale since 1940; previously sat for Camberwell N.W.

*Sir Henry Morris-Jones, Denbigh, Liberal National.

(1906). For more than 20 years a general practitioner at Colwyn Bay. Former chairman of the local B.M.A. Division. M.P. for Denbigh since 1931. Former Junior Lord of the Treasury and Government Whip.

David Stark Murray, Richmond, Labour.

(1925). Pathologist, Kingston Laboratory E.M.S., and honorary pathologist, Royal Hospital, Richmond, and associated hospitals. Prominent in Socialist Medical Association. Editor, *Today and Tomorrow*.

*Basil H. H. Neven-Spence, Orkney and Shetland, Conservative.

(1911). Served much abroad, in Egypt and the Sudan and in Palestine. Formerly specialist physician, Aldershot Command. Retired 1927. M.P. for Orkney and Shetland since 1935.

*Sir John Boyd Orr, F.R.S., Scottish Universities, Independent.

(1912). Director, Rowett Institute, Aberdeen, and Imperial Bureau of Animal Nutrition. Chairman of B.M.A. Charter for Health Committee. Joint Editor *Nutrition Abstracts and Reviews*. Author of works, including *The National Food Supply* and *Food, Health, and Income*. Member of several Government Committees. Entered Parliament at recent by-election.

William Bernard Joseph Pemberton, Bermondsey W., Liberal National.

(1920). Received medical training and held early appointments in Dublin. Now practises in Bermondsey. Public vaccinator in that borough. Now candidate for the seat from which Dr. Alfred Salter (Labour) has retired.

Samuel Segal, Preston, Labour.

(1927). Squad. Ldr., R.A.F. Formerly on junior staff of Westminster Hospital.

Dorothy Anderton Sharpe, Chelsea, Common Wealth.

(1930). Assistant gynaecological surgeon, Elizabeth Garrett Anderson Hospital, and assistant obstetrical surgeon, Royal Free.

R. Scott Stevenson, Fife W., Liberal National.

(1912). Served during the war as otologist to a military hospital, major, R.A.M.C. Surgeon, Metropolitan Ear, Nose, and Throat Hospital; consulting laryngologist, L.C.C. Hospitals. Formerly Joint Editor *Practitioner*. Has served on B.M.A. Council and many headquarters committees.

Malcolm Stoddart-Scott, Pudsey and Otley, Conservative.

(1926). Educated at the University of Leeds. Col., A.M.S.(T.), A.D.M.S., 48th Division, Territorial Decoration. Assistant medical officer, V.D., Department, General Infirmary at Leeds.

Barnett Stross, Hanley, Labour.

(1925). General practitioner, Stoke-on-Trent. Medical adviser, Pottery Workers' Society and North Staffordshire Miners' Federation.

*Edith Clara Summerskill, Fulham W., Labour.

(1924). Medical director, Birth Control Clinic, West Fulham. M.P. since 1938. Prominent member of Socialist Medical Association.

Halliday Sutherland, Scottish Universities, Labour.

(1906). Ex-president, Tuberculosis Society. Author, *Pulmonary Tuberculosis in General Practice* and several other works, including two volumes of autobiography.

Stephen J. L. Taylor, Barnet, Labour.

(1934). Head of Home Intelligence, Ministry of Information. Neuropsychiatric specialist. Formerly hon. secretary, Osler Club, and assistant editor, *Lancet*.

*William Stanley Russell Thomas, Southampton, Liberal National.

(1919). Barrister-at-law, Lincoln's Inn. Formerly assistant medical officer, West Riding Asylum, Wakefield. M.P. for Southampton since 1940.

HEALTH POLICY OF LABOUR AND LIBERAL PARTIES

In his "Appeal to the People" last week-end Mr. C. R. Attlee made no specific reference to health services, but reaffirmed his Party's acceptance of the principles and policy set out in its declaration of policy entitled *Let Us Face the Future*, published earlier this year. This declaration contained the following under the heading "Health of the Nation and its Children":

> "By good food and good homes much avoidable ill-health can be prevented. In addition the best health services should be available for all. Money must no longer be the passport to the best treatment.
>
> In the new National Health Service there should be health centres where the people may get the best that modern science can offer, more and better hospitals, and proper conditions for our doctors and nurses. More research is required into the causes of disease and the ways to prevent and cure it.
>
> Labour will work specially for the care of Britain's mothers and their children—children's allowances and school medical and feeding services, better maternity and child welfare services. A healthy family life must be fully ensured and parenthood must not be penalized if the population of Britain is to be prevented from dwindling."

The Liberal Party, in its 20-point manifesto to electors, sets out its views on health in the following terms:

> "People cannot be happy unless they are healthy. The Liberal aim is a social policy which will help to conquer disease by prevention as well as cure, through good housing, improved nutrition, the lifting of strains and worries caused by fear of unemployment, and through intensified medical research. The Liberal Party's detailed proposals for improved health services would leave patients free to choose their doctor, for the general practitioner is an invaluable asset in our social life."

POSTGRADUATE EDUCATION OF SERVICE MEDICAL OFFICERS

The Department of Health for Scotland announces the following addresses to which medical officers on release from the Services should apply for information and advice about postgraduate facilities in Scotland:

St. Andrews: Prof. Tulloch, Dean of the Faculty of Medicine, Medical School, Dundee. Tel. No. Dundee 3686.

Aberdeen: Prof. R. S. Aitken, Department of Medicine, Foresterhill, Aberdeen. Tel. No. Aberdeen 6060.

Edinburgh: Prof. Sydney Smith, Dean of the Faculty of Medicine, University New Buildings, Edinburgh, 8. Tel. No. Edinburgh 41001. (Also acting as central office for Scotland.)

Glasgow: Prof. J. Hendry, Department of Obstetrics and Gynaecology, The University, Glasgow. Tel. No. Glasgow Western 3991.

The corresponding addresses for England and Wales were published on June 23, p. 125.

HEARD AT HEADQUARTERS

Increased Litigiousness

Are patients becoming more litigious? It appeared so from the analysis given by the treasurer, Mr. W. M. Mollison, at the annual meeting of the London and Counties Medical Protection Society the other day. Last year the legal costs in defence of members were equivalent to 4s. 11d. per member, an increase of one shilling on the year before, and adverse costs and damages 6s. 4d. per member, an increase of 2s. 8d. These figures fluctuate from year to year, and one big case may make a great deal of difference, but they gave point to the terse counsel which the new president of the society, Sir Ernest Rock Carling, gave to the members.

One thing on which he insisted was that directly a case appears, so to speak, above the horizon the society should be informed. Many matters are referred to local solicitors before the society is consulted, and however well intentioned the solicitors may be, the subsequent action by the society may be prejudiced. He also deprecated settlements against the society's advice, saying that their experience was that such settlements were just as likely to prejudice a man's practice as an unsuccessful defence. Another point made by Sir Ernest was that if a practitioner saw occasion to vary the treatment he had proposed or discovered that he had made a mistake, he should frankly explain his action or his mistake to the relatives at once. Many actions, he said, would have been avoided if a simple explanation had been given at once. One thing brought out in the experience of the defence societies is that the practitioner of the greatest competence and skill, who takes the utmost care over his cases, is by no means exempt from peril. In two cases which the London and Counties has recently defended, and which cost it a great deal of money, Sir Ernest said that nothing but sympathy could be felt for the practitioners concerned, for the same misfortune might have happened to any one of themselves.

"The Family Doctor"

A "short," in film language, depicting the work of the family doctor, has lately been completed by Everyman Films, Limited, by arrangement with the Public Relations Committee of the B.M.A. It was shown to some members in the small theatre at the Ministry of Information on the day after the recent meeting of Council. It is restrained and dignified in its presentation, and both script and picture have been prepared with care so as to avoid the possibility that mischievous persons might hold it up to ridicule.

The question whether the film will be generally shown rests with the cinematograph trade houses, which determine how the greater part of the British public shall be entertained and instructed. The trade has, however, shown that it appreciates that in addition to its ordinary millionfold clientele, who would be faithful to their weekly pictures in any event, there is another world of infrequent cinemagoers who are attracted by serious and purposeful films. The welcome given to such films as that on the work of Madame Curie, and the earlier one depicting the achievements of Pasteur, shows that there is a public for such presentations. "The Family Doctor" is not as ambitious as these, but it is a sympathetic depiction and an accurate one, not overlaid with sentiment, but really informing.

"Volims"

We live under the tyranny of initials, encouraged now more than ever by Army usage. Such monstrosities as U.N.R.R.A. and N.A.L.G.O. are pretty well understood, but what is V.O.L.I.M.S.? A booklet is before me, the product of the Volims Committee, and it deals with a plan for a regional consultant and specialist medical service based on university medical centres. "Volims" turns out to be a word made up from the arbitrarily selected initials in the phrase "Voluntary hospitals Of London, which are Independent of undergraduate Medical Schools." But whether the name be happy or not, the plan propounded is one well worth studying. It proposes that the country be divided into university regions and that there shall be one or more university medical centres in each region based on a central hospital. The university centre is to be the pivot for clinical units in all departments of preventive and curative medicine, but there is also to be a co-ordinator of research and a clinical co-ordination department. There are many other proposals much too big to be dismissed in a paragraph, but there is also a scheme, with which the name of Mr. H. E. Griffiths is associated, for a whole-time industrial medical service centred on the university. This is to be under the control of a director of industrial medicine and to comprise a team of industrial medical officers (and nurses) to be responsible for the supervision of the industrial health of the community. The director of industrial medicine, in collaboration with the dean of the medical school, would also be responsible for the teaching of industrial medicine. The address of the Volims Committee is 28, Portland Place, London, W.1.

Publicizing Local Government

A very interesting report by the Nalgo (National Association of Local Government Officers) Reconstruction Committee has come into my hands. It is full of ideas for making the proceedings of local authorities, including public health committees, of more general interest. It urges the appointment of public relations officers and the holding of press conferences. It is often complained that local authorities transact their important business in committees, and matters come before the council in public only for the rubber stamp. Nalgo does not exactly suggest that committee meetings should be open to the Press—it would not be advisable, for example, to have open meetings at which the claims of officers for promotion were discussed—but it does recommend that the minutes should be available for the Press, and that such minutes should be phrased with the Press and public in view.

In this connexion the practice of the L.C.C. seems to be admirable. The agenda of the council meeting contains reports of committees so extensive and complete that the Press has no difficulty in constructing a "story." Another suggestion is that more use should be made of the cinematograph film, both to inspire civic patriotism and to inform the public of the services available.

Correspondence

Medical Demobilization

SIR,—I am at present on a month's leave from over-seas, and have just received the Central Medical War Committee's circular letter, D. 11, of May, 1945.

I have been away from England for over three years; during these years I have worked nearly as hard as I would have in civilian life; the work has been interesting and, I think, useful (in this respect I have been luckier than some of my colleagues). Now, however, after taking three months to reach England for my leave I have before me the prospect of a return to my Army duties for a few more [illegible]ore I *should* be demobilized [illegible] I am posted to U.K. under the "Python" scheme. In other words, I, like thousands of others, am facing an immediate future of comparative idleness in the performance of duties which could well be carried out by a man twenty years my senior. Not unnaturally this becomes increasingly irksome when the local population of the district in which I practised for two years before the war is crying out for more doctors, and when my practice is, inevitably after so many years' absence, disintegrating before my eyes.

I do not write this letter, however, for any personal reasons. I merely mention my own circumstances so that, multiplied thousands of times, they may serve to impress upon the committee in particular and non-Service doctors in general that a tide has been reached in the affairs of Service medical personnel which, if not taken now, must lead very shortly to extreme financial misfortune and general discontent.

Doctors in the Services, and especially those over-seas, have had the subject of demobilization very much in mind in the last six months or more. We have wondered what was being done on our behalf to make this as speedy as possible; what arrangements were being made to replace us (if necessary) and to help us with the post-war training which we so sorely need. We are not unreasonable or unduly impatient, and we are content to carry on with our Service duties, however unnecessary and irksome they may appear to us (and most of them could be quite adequately performed by third-year medical students in four hours' work a day, or by non-medical administrative officers), providing we are assured that arrangements for our demobilization are well in hand, adequate, and just.

Regrettably I must confess that, so far as I am concerned at any rate, the committee's letter has given us no such assurance. On the contrary, six years after mobilization and one month after the cessation of hostilities in Europe, we are given no concrete and established policy, no facts or figures relating to the mobilization of our colleagues in civilian life, and no final answers to the questions with which we are most concerned. In their stead we have intentions and promises with regard to mobilization and demobilization, and apologies for the inadequacy of the present postgraduate training scheme. In other words, we still would seem to be in the stage of words and not deeds. I do not wish to be unfair to the committee, whose work on our [illegible]alf has been and is appreciated; may [illegible]efore, give some detailed reasons [illegible] views which I have expressed

First, about demobilization: one of the main queries of Service personnel has been, "Does the Government's scheme for the reallocation of man-power apply also to doctors?" The committee gives no answer. One may presume that it does not, for the committee *believes* that if the scheme could be made to apply to doctors we would ask no more than that. Such an assumption is, I think, correct, but surely after six years we have a right to expect more than the belief in a possibility.

Next we ask the committee, "Since demobilization under Scheme 'A' is not expected to be as satisfactory or prompt for medical officers as for those employed in other branches of the Services, what alternative or additional measures are suggested?" This question is answered, for we are told that the key to the problem lies in the recruitment of civilian doctors. Hopefully we look for evidence of action in this respect, and we find that this, too, is in the "intention" stage.

May we be forgiven if we find it difficult to let this matter rest? Doctors in the Services consist in the main of young men recruited from hospitals immediately after qualification, a restricted period "on the house," or a year or two in general practice, together with the younger consultants and those who were training for a specialist career. Almost without exception these men have given what are usually considered to be the best and most important years of their lives to the Services in return for a mere pittance of a salary compared with what they would have earned had they not joined up; in addition they have seen their practices dwindling sadly and their clinical knowledge and experience neglected; some have been permanently disabled and others have given their lives. These do not ask for the sympathy of the committee or to be told that the difficulties and hardships they have suffered are well known, but they have the right to compare their lot unfavourably with that of their colleagues who have remained in civilian life. These latter may have been carrying "almost intolerable burdens" and been "worked to death" (in the words of the committee), but they have also (not in the words of the committee) lived their lives with their wives and families and in their own homes, earned salaries in excess of their peacetime incomes, and maintained or increased their practices (one hesitates to say that this latter has been at the expense of their Service colleagues, but the well-intentioned B.M.A. Protection of Practices Scheme seems, almost inevitably after so many years, to have had disappointing results). In addition, there are those among them who did not join the Services because of "local requirements," which, being interpreted, means that some of their colleagues, of like age or younger, joined up before them.

The committee is right when it assumes that we have never expected equal sacrifices for all; it is now for the committee to prove that we are wrong in our assumption that the sacrifices have been to date, and will be in the future under present arrangements, mainly one-sided. It is our contention that young (or once young) medical officers who now spend idle hours in static units or in the military administration of occupied territories, whose practices are "dwindling sadly" in their absence (a mild term, one feels), whose clinical experience has been seriously yet unavoidably neglected, and whose families and homes know them only as strangers, should be replaced by their colleagues in civilian life under, say, 45 years of age. These latter are more suited for the sedentary employment now offered by the Services, and should be prepared to spend a few months away from their practices and their families. The committee may rest assured that Service doctors are only too willing and anxious to bear the intolerable burdens of civilian practice and know that their only chance of survival lies in working themselves to death after demobilization.

No civilian doctor and no Service medical officer is irreplaceable; let each, therefore, replace the other. This, then, is our next question to the committee: "How many civilian doctors have *already* been mobilized as replacements for Service medical officers? What action (in detail) is being taken to obtain these replacements, and is the selection being made purely on the advice of committees composed of local practitioners and consultants? Why does the committee 'intend' to call up these practitioners: has it not had time to put its intentions into practical effect?"

So much for mobilization and demobilization. I would refer now to a further problem to which the committee does not give a satisfactory answer—the general dissatisfaction felt by Service medical officers at the conditions attached to demobilization under Class "B." Is it not grossly unjust that doctors released from the Services at the request of local committees and because of local needs should be expected to sacrifice the leave with pay which is their due? I refer here especially to those with oversea service who, in addition to the eight-weeks normal grant of leave on demobilization under Class "A," receive one day's leave for every month of service abroad—few would take the leave but many would be grateful for the pay when settling into their practices again or starting on a post-war career.

The committee appears to accept this exploitation as a necessary evil; is action already being taken to modify or remove this injustice?

On the subject of postgraduate training one can only join with the committee in deploring the inadequacy of the two-weeks "refresher" course offered to Class 2 medical officers. Most of us reckoned that the first three months after demobilization would have to be set aside for postgraduate training (we owe it to our patients, and the Government owes it to us), and it is only fair to suggest that the cost of such a course should be borne by the Government. Presumably, if such a course is persisted in under present arrangements the cost, as usual, will have to be borne by the individual. The idea of giving up two days a week from one's practice is, of course, laughable. The salary offered to Class 1 medical officers (who are now six or more years older than when they enlisted) will drive many of them into practice without any postgraduate training; few with families and homes to maintain will be able to afford such a course under post-war conditions.

Finally, those over-seas and thousands of miles from their practices would feel more satisfaction if the local requirements for doctors were assessed and applications for demobilization judged in the first place by committees consisting not only of local practitioners and consultants but also, in part, of medical or non-medical officers from outside the district. Similarly, one would like to be assured that the Services are represented on the Central Medical War Committee (and I do not mean only by specialists in uniform).

and that it is not entirely civilian in its representation.

I have given my views as frankly as I am able; they have been modified or extended as a result of conversations I have had with all classes of medical officers during my long journey home. If I have been guilty of under- or over-statement or of any serious omissions I hope that my Service colleagues will correct me without delay (and in this respect I fully realize that I have glossed over the consultant's point of view, and he may be the worst sufferer of us all). I would repeat that we are grateful for the Central Medical War Committee's efforts on our behalf, and are not unmindful of the difficulties it has had to overcome and with which it is still faced. I hope we shall not be considered guilty of ingratitude or impatience if, in desperation at this stage in the war, we ask for results and not promises, just treatment and not apologies.

If, in fact, this letter appears to be petulant or over-critical in its nature, may it please be regarded as a direct result of the perturbation and dismay aroused in a "foreigner" by the contemplation of an immediate future represented by mere hopes and intentions as outlined by the Central Medical War Committee's letter under discussion.—I am, etc.,

RONALD GIBSON,
Lieut.-Col., R.A.M.C.

*** The Secretary of the Central Medical War Committee writes: The Central Medical War Committee is still awaiting complete information as to the medical officers in the earlier release groups whose release will or will not depend on replacement. It is necessary to know which officers will be returning, with or without replacement, to the various localities and which have elected to serve for a further period. As this information is received the committee will carry out with the least possible delay the intentions stated in its recent circular. Meantime, the recruitment of younger practitioners, including men of graded specialist status in B1 hospital posts, is proceeding continuously.

As regards sacrifice of benefits when an officer is released out of turn, the committee is advised that it is not possible to alter, in the special case of medical officers, a policy which affects members of the Services generally. Often a man will gain by earlier release, and in no case will a man be released out of turn without his consent. As the circular explained, the salary in Class 1 of the postgraduate scheme will be supplemented when necessary by a grant under the Further Education and Training Scheme. There should be no question of a released officer with family commitments being unable to take advantage of the scheme through lack of means.

The C.M.W.C. is necessarily a civilian committee, and the only Service representatives are members of the staffs of the Service Departments, who attend as observers. Serving soldiers take no part in the recruitment of non-medical personnel. It is not clear why there should be a different rule in the case of doctors; nor what advantage would be gained at this stage by altering the composition of Local Medical War Committees.

Demobilization of Final-year Students

SIR,—When called up a year ago I was a final-year medical student at a London hospital, within ten months of qualification. My progress was considered by my tutors to be satisfactory and promising. I was nevertheless called up, the reason being that I had been de-reserved *two years* previously for failure to pass one of my examinations within the prescribed time-limit. I was, however, successful in this examination at the next attempt.

The present shortage of doctors in the country is apparently causing concern to the medical profession. Would it not, therefore, appear to be sound policy to release final-year students under Class "B" and so enable them to qualify and, if necessary, return to the Forces in their true and more useful capacity in about twelve months' time? I myself am no longer of medical category A1, and there is, therefore, no job in the Army for me which could give greater service to the country than that of completing my qualification as a doctor.

There must be a considerable number of fairly advanced students in the Forces, most of whom will not obtain their release under Class "A" arrangements for at least another year, or perhaps two. By that time the majority will have decided that the difficulties of returning to study are too great after so long an enforced abstinence therefrom, and will be lost to the ranks of the profession for ever.—I am, etc.,

"INFANTRY PRIVATE."
